T the second ordinary meeting of the session of the Institution of Civil Engi- s on Tuesday, the 17th of November, three rs were read relating to Portland cement Portland cement concrete. The first was rtland Cement: its Manufacture, Use, and ting," by Mr. Henry Kelway Bamber, F.I.C. author gave analyses of the most suitable s and chalk to be used in the manufacture 'ortland cement, and described the process of aring and mixing these ingredients, drying resulting slurry, and of burning. The age composition of good cement was indi- d. In these operations care and constant nical testing were necessary to keep the edients in proper proportions, so as to insure regular percentage of each in the finished ent. Reference was made to the packing in kilns of the dried material in lumps of a size oo large to prevent the heat from being evenly ibuted through the entire kiln, otherwise e would be a large proportion of insufficiently ed and unclinked produce. In clinkering, material entered into semi-fusion only, and it during this process that the properties of cement were produced. Given, therefore, er proportions of ingredients and proper ing, so as to obtain good clinkers, the result ld be good cement. This had next to be nd to fine powder and sifted, so that all ld pass through a sieve of 2,500 meshes to square inch, and not less than 90 per cent. ld pass through a sieve of 5,625 meshes to square inch. The finer the cement the easily was it thoroughly mixed with r, which insured its proper setting with- the chance of blowing afterwards. About of water should always be used to y cubic foot of cement. This would e that every portion of cement should the full quantity it could combine with, and is were done no blowing could take place, use blowing was caused by portions of cement g up water and expanding after the body e cement was set. The author made exnents three years since with concrete com- l of 4 parts of shingle, 2 of sharp sand, and cement. These were mixed in duplicates, irst lot with the full quantity of water it l take, and the others with only half that quantity of water. These blocks after 24 hours were put on a wall and were covered twice every day for twelve months by the tide. At the end of the year they were cut through the centre. Those made with the full quantity of water were sound, hard, and perfectly dry all through; those made with half the quantity of water were wet through, and easily broken to pieces. As there was no difference in any of the ingredients except the quantity of water used, this showed that for concrete to set properly and satisfactorily it must at the outset have the full quantity of water mixed with it. These blocks were made with new cement a day or two old, showing that new cement was perfectly safe if mixed in proper proportions. In the ordinary course cement would be about a month old when used, and there was no advantage in keeping it longer, for it began to lose its power of combining with water, an old cement not being able to absorb and combine with nearly so much water as new cement. In newly-ground good cement the particles were in such a molecular state as to quickly combine with water, forming a hard permanent crystallised solid. By age there was evidently a molecular change gradually taking place, for after a time the cement, although not exposed to the air, lost its power of setting when mixed with water, although the percentage composition might be exactly the same. The author then described the best test to determine if the cement were good:—First there should be a chemical analysis to show the proportions in which each constitutent existed, but as this in itself was not sufficient to show if the cement had been fully clinkered, he recommended the taking of the specific gravity which should not be less than 3·10 to 3·15 at the end of a month. This was much more reliable than the ordinary use of the striked bushel, which varied considerably, according to the way in which the vessel was filled. Then ensued the mixing of the cement with water and the forming into briquettes to test the breaking-strain at 7, 14, and 28 days; the quantity of water in these briquettes varied with each manipulator, the general desire being to use as little water as possible. The author thought, however, that it should be stipulated how much water should be used in making the briquettes, when the results with the same cement would be more uniform, for a cement that could not take up its full quantity of water, 20 per cent. to 25 per cent. of its weight, was not as good as one that could do so, other things being equal. A good cement, not too old, would expand in setting and completely fill the space allotted to it, whereas an old cement would not do so, and consequently spaces would be left for water to enter and weaken it.

The second paper, by Mr. Alfred E. Carey, M.Inst.C.E., was entitled "The Inspection of Portland Cement for Public Works." The author emphasised the following points: Uniformity of the raw materials; completeness of the mechanical blending of the raw materials; the proportion of carbonate of lime; the thoroughness of the wet-grinding; the burning; the flouring; the aëration and packing of the finished cement. Particulars were given of the chemical analysis of various clays in use, and it was pointed out that the hydraulic factors were the silica and alumina, with iron, and that the highest standard of quality was probably attained when the ratio between these was $\frac{\text{Lime}}{\text{Hydraulic factors}} = 2$. The various processes for the mechanical blending of the raw materials were described, and special stress was laid upon constant chemical testing at this stage of manufacture, and also on the thoroughness of the blending in a wet state. In regard to burning clinker, the author traced the various chemical changes which took place, and the corresponding temperatures. He considered that a temperature of about 2,900° Fahr. maintained for a short time only, was the most favourable for producing high-class clinker. He described the more recent systems of burning cement, giving details of the Ransome and Joy processes, and advocated the adoption of the test by specific gravity instead of by weight per bushel. He proposed for this standard 3·1, a high specific gravity combined with extreme fineness, being one of the surest means of proving that a given sample of cement was well burnt. In respect of fine-grinding, it was pointed out that it was the flour or impalpable powder which formed the effective part, the nibs or course residue forming an adulterant similar to the admixture of a corresponding proportion of sand. This was proved by a series of experiments, in which the residues, on a succession of sieves, were removed from a given sample of cement, when the tensile strains were proportionately increased. The question of the dry-grinding and the temperature of the cement, as it left ordinary millstones and edge-runners respectively, was then referred to. The author considered aëration essential with cement as now usually manufactured. With regard to packing, the want of a less expensive and more efficient packing case than the ordinary cement barrel was mentioned. The author suggested that for foreign works clinker might sometimes be conveniently exported and ground on the spot. As to the question of testing, he considered that a test of $\frac{1}{2}$in. by $\frac{1}{2}$in. section would in some cases be a useful guide, and described the various apparatus now in use for the purpose of compression-testing, calcimeter-testing, taking specific gravity, &c. On the question of standard regulations, the rapid progress which had been achieved in quality in England, despite the absence of any Government tests, was pointed out, and it was stated that, had such a standard been formulated ten years ago, its effect would probably have been retrograde. The practice of foreign governments and societies as to standard tests was detailed, and a specification was given applicable to the present stage of cement production. Minute particulars of the various points to be noted in gauging briquettes were given, and the subject of the adulteration of cement was dealt with. The author did not believe adulteration was much practised in this country, although the Society of German Cement Manufacturers had thought it desirable to formulate special rules on the subject as regarded Germany. In dealing with the use of cement, the author stated that, in his opinion, cement and concrete were likely to take the place in many respects of iron and timber as now applied. He also gave particulars of a series of experiments carried out by Mr. Joseph Cash, M.Inst.C.E., at his request, in order to test the power of Portland cement to resist long-continued hydrostatic pressure. These tests were made with concrete of varying proportions, and a further series was carried out to ascertain the extent of the penetration of cement on the surface of a mass of rough concrete. Another series dealt with the question of the extent to which rough concrete would prevent filtration. The efficacy of rendering a surface of concrete in connection with hydrostatic pressure was also discussed. The quantity and purity of water for concrete making was referred to, the author detailing the results of the admixture of fine river-mud of varying proportions on the strength of concrete blocks. The effect of the presence of sulphuric acid as observed by experiment was given, as also the effect of frost upon cement briquettes and *per contra* of high temperatures such as prevail under tropical conditions. The effect of sea-water on the maturing of concrete was dealt with, the author considering that when gauged with sea-water concrete matured more rapidly and passed more quickly into the crystalline condition than when gauged with fresh water. The limits within which concrete might be safely applied, more especially on works in the sea, were defined, it being shown that two distinct issues had to be considered in dealing with this much debated subject:—1. The influence of magnesia as an ingredient in the manufacture of cement. 2. The alleged deterioration of sound cement when subjected to the action of sea-water. He showed that caustic lime or caustic magnesia were both harmful in cement; but that a high percentage of magnesia, when clinker was well burnt, was not necessarily deleterious. In dealing with the second branch of the subject, the author pointed out the desirability of Portland cement not containing more than 4 or 5 per cent. of magnesia, because this material was really an adulterant and not actively useful. He detailed particulars of a series of experiments with cement-sand briquettes of varying proportions, which had been exposed to long-continued tidal action without harmful effects, and gave the increase in the weight of these briquettes. He also referred to a series of tests with fresh-water, varying proportions of fresh and sea-water, and sea-water partially evaporated, it being pointed out that in situations in which ammonia might be brought into contact with concrete it was desirable to use fresh-water for gauging, and to

exclude cement containingiany considerable proportion of magnesia. The author's opinion was, however, that no conclusive evidence had been adduced to prove that the precipitates from sea-water induced disintegration of even fissured or porous concrete when sound cement was used. In conclusion, the author referred to the chemical and physical transformations of Portland Cement in setting, and the general chemical conditions under which Portland cement of the highest class was obtained.

The third paper read was on "The Influence of Sea-water on Portland Cement Mortar and Concrete," by Mr. William Smith, M.Inst.C.E., of Aberdeen. In the course of a discussion which took place at the Institution in the year 1886, the author, who was the engineer of Aberdeen Harbour, had stated that since the construction of the south breakwater at that place, in 1872, he had noticed "the disintegration of the surface of the concrete by the chemical action of the salt-water on the Portland cement." The softening and swelling of the concrete wing-walls at the entrance of the graving-dock induced him in the following year to refer the matter to the late Professor Brazier, of Aberdeen University, for a thorough investigation of the chemical reaction causing disintegration. In June, 1887, that gentleman gave his opinion that the analyses of the series of decomposed cements (concrete) showed a remarkable difference in composition from the original cement, inasmuch as in all the samples submitted to him there was found a large quantity of magnesia, and a large proportion of the lime was in the form of carbonate. He believed that this alteration was brought about entirely by the action of sea-water upon the cement. There was no other source for either the magnesia or the carbonic acid. The author then reported that "the rapidity of the chemical action was due to the unbalanced pressure of the water on the wing-wall" when the dock was emptied. This caused a current of sea-water through the porous structure of concrete, which continually washed the decomposed cement into the dock, and brought new particles of concrete into contact with the sea-water. In July, 1887, Mr. P. J. Messent, M.Inst.C.E., was requested to make an independent investigation of the cause of the deterioration of the concrete, and in the following November issued a report confirming the results obtained by the author and Professor Brazier, by experiments at the Tyne Piers and by additional analyses of the disintegrated concretes by Mr. Pattinson, the public analyst for Newcastle-on-Tyne. From a series of experiments and investigations by Professor Brazier and himself, the author inferred the cause of the expansion of concrete, subject to the influence of sea-water, to be the formation of a more bulky compound of magnesia and lime with carbonic acid, and especially with sulphuric acid and water, in place of the lime of the cement. The chemical equations for the action of the lime in the cement upon the magnesian salts in sea-water were: Magnesia chloride + calcic hydrate = magnesic hydrate + calcic chloride. Magnesic sulphate + calcic hydrate = calcic sulphate + magnesic hydrate, the sulphate of lime crystallising with water as: Calcic sulphate + water = hydrated calcic sulphate, a substance of great bulk compared with the lime base. The lime of the cement took up the free carbonic acid from the sea-water, forming carbonate of lime; the sulphate, carbonate, and hydrate of magnesia in the sea-water were filtered out and united with the lime, forming a deposit of magnesia and hydrated sulphate of lime, which, being bulkier than the lime base, caused swelling and disintegration of the concrete, while the magnesia destroyed the adhesive power of the cement. The author proceeded to point out, from experimental tests carefully made, that the presence of magnesia in the cement, before mixing with water and setting, was not the cause of subsequent disintegration, and that even 5 per cent. of magnesia in the cement only diminished its tensile strength 20 per cent., causing no tendency to disintegration. Sulphate of lime and carbonate of lime might similarly be present in the unslaked cement without much harm or any tendency to subsequent disintegration of the concrete. The disintegration was clearly due alone to the chemical reaction between the sea-water and the lime of the cement. All the lime (about 60 per cent.) of the cement was, so far as affected by this action, quite free, there being no stable chemical combination of the lime, alumina, &c., in cement. A series of experiments on the filtration of sea-water from a height of 24ft. through porous blocks of concrete was given in a tabular form in an appendix, showing, by the gradual decrease of the quantity of water passing through, the closing up of the pores of the concrete by the accumulation of the chemical by-products in the material. The paper concluded with a description of the effect of the compression of air by the inflow of sea-water to cavities in the breakwater in bursting out the concrete blocks forming the sides of the cavities. The conclusions arrived at were: That the chief causes of the destruction of concrete sea-works were the chemical action of sea-water, and the sudden compression of air within the structure by waves; and that the same remedy applied to both evils—viz., the formation of an impermeable homogeneous structure.

MODERN EGYPTIAN BUILDINGS.

AT the Royal Institute of British Architects on Monday evening, a paper on "Modern Egyptian Buildings," with special reference to the erection of Mena House, near the Pyramids of Gizeh, read by M. H. Favarger, of Cairo. Limelight illustrations of the work were shown. Mr. J. MacVicar Anderson, the President, occupied the chair. M. Favarger remarked that when the Suez Canal was opened the Khedive Ismail had a road made to the Pyramids of Gizeh and two houses built, one on each side of the road. The one on the lower ground, to the north of the monument, was sold by the present Khedive, and, being purchased by an English capitalist, formed the central point round which had been grouped the various buildings forming the hotel known as "Mena House." Towards the end of 1888 M. Favarger was commissioned to add a dining-room and more bedrooms; and in May, 1889, some fifty other bedrooms and reception-rooms were to be added. Plans were prepared, and tenders invited from contractors in Cairo, for the small amount of work first decided upon; but the prices seemed so high that it was determined to engage native workmen and make the work under supervision. A young Swiss who had had some experience of building in Egypt was engaged as clerk of the works, and the work commenced. The stone for the rubble-masonry walls was taken from a large unfinished building which was built of stone and mud. The larger work, in the following spring, necessitated the collection of a stock of stone, and permission was obtained to use the débris of stone around the Pyramids. Erroneous statements had been made that the Pyramids were being stripped of their casing to enable the hotel to be built, and the author took the opportunity to explain the actual facts. The museum authorities, under whose control all the old Egyptian monuments were, refused to allow a single workman near the Pyramids, but employed their own men to clear away the rubble from certain points that interested them, and, after it had been searched for inscriptions, certain portions were allowed to be taken away—an arrangement that gave absolute security that the monuments would not be injured. When making the greater additions to the house, it was decided that they should be at right angles to the old buildings and their southern face become the main frontage. A carriage-drive from the road led to the main steps, and, passing through a large wooden verandah, the visitor reached the entrance leading into an antechambor, and then to the hall, with the staircase some distance off. The drawing-rooms faced east, and the library south, while westward was the staircase, placed so as to serve, with its alternate landings, the several floors, first to the east and then to the west. The billiard-room was built outside the house, top-lighted, and connected with the card-room by arches in the main wall. Moule's earth closets were used, but in a separate block from the house, approached on each floor by a roofed bridge opening out of the lavatories. The bedrooms were divided into tiers of three, each tier being half a flight higher than its neighbour, with the English single-leaf door instead of the French double door. The elevation was simple, and the labour being only Arab, rubble ashlar, unplastered, was selected, as being the nearest to the usual native style of work. While these works were in progress stables were erected on the opposite side of the Cairo road, which could accommodate over 150 animals; and a large open-air swimming-bath and a steam-laundry were constructed. The water supply was derived from a well on the ed of the desert. In 1890 further additions w decided on—among them a house to serve as estate office, and eventually as an annexe to hotel. This was built of sun-dried bricks, a consisted of six rooms on the ground floor, w eight bedrooms and offices above. A foundat of rubble masonry was carried up 3ft. above ground, and on that were built the walls of first story, to the thickness of nearly 3ft. T settlement was considerable, but so even that only harm was that the plastering of the v came down. In the design of the dining-hall Eastern Saracenic architecture was adapted modern requirements. The hall was to be a f ture of attraction, and, while providing with co fort for about 100 persons, was to be capabl accommodating 250 persons. Two levels, the fore, were given to the room, the main ro having a raised corridor round it, which g great scope for the introduction of arches. T four principal arches of the main room form the special feature of the hall. The author p ceeded to describe the vestibule and the ro and then turned to the various styles of build in Egypt. Firstly, the mud buildings, wh were constructed of mud bricks dried in the s the binding material being also mud. This m a warm, comfortable house, and the settlem though considerable, was even. Secondly, st and mud building, which was a favourite met with the Arabs in districts where fuel for mak lime was not easily to be obtained; and it surprising how long such buildings lasted Egypt. Thirdly, rubber-ashlar buildings stone and lime, with courses of bricks every to give a fresh level to the work and equalise pressure on the walls. Having dealt with qualities of limestones, lime, sand, timber, other materials to be obtained in Egypt, Favarger turned to the question of labour. workmen were almost entirely Arabs, dire by European foremen. Among the Arabs a clever and intelligent masons and carpen were to be met with, but the majority were dolent and ignorant, and difficult to deal w For rough labour, the Arab was not unsuita properly supervised. Of plumbers there a sad lack. Blacksmiths and engineers v fairly intelligent, and were generally Ital or Germans. That good work could be d however, was evident by Mena House b an accomplished fact, but it was hardly crec the amount of supervision which was necessa

On the motion of Mr. R. Phené Spiers, secon by Mr. Thomas Henry, the customary vot thanks was accorded to the lecturer.

CARPENTRY AND JOINERY.—XL

ENTABLATURES AND PEDIMENTS.

WE come now to treat of entablatures order to make them a step to pedime The use of the term "entablature" for this of door finishing is probably not techni correct, but it is very commonly used, because of that, is adopted here.

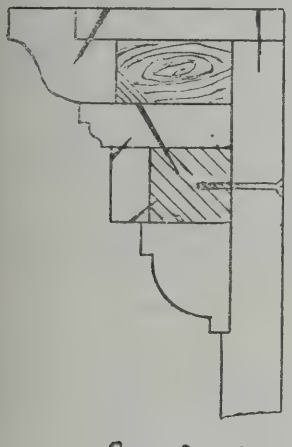

Fig. 275 gives a very simple kind of enta ture indeed. It is very slightly modified the section of a pediment taken from a cou mansion. It will readily be understood tha section given would be suitable for the pedi so far up as to the ogee or top moulding, w is seen to be rebated for the covering be The top moulding would take the sloping tion; following the outline of the tympanu triangular panel of the pediment, but this w dealt with anon. By looking at Fig. 275 seen that what forms the groundwork of entablature is the frieze or fascia.

The remarks made about Fig. 270 will a here also in case of valuable timber being u Pine, of course, will serve where it is seen. Let this be understood throughout, applies to mouldings forming the section as as to the fascia. The various mould required to build up the entablature will no prepared. Just by way of preparing these, viding that for the joiner the foreman has down an outline or section similar to Fig then a tracing on paper (tracing) will be ta and as previously stated, the writer's practi to use carbon paper for transferring this t veneer, which is to be cut out as a patte template of the section of the moulding. If a small quantity of the moulding is require may be wrought by hand, in which case template will be used in making the ends o

iece of timber prepared for the moulding, hich ends are usually chalked after being laned, so as to present a level surface for the arking. The pencilling shows out better on the alked end; but if the mouldings are prepared y machinery, several methods are adopted; one ractice is to work a piece of moulding of the equired section about 18in. or 20in. long of soft ine, and to this the machine man sets the irons of is moulding machine. Another is, in some shops, uitable irons are put in the revolving head used n the general joiner, and the ends of the pieces eing chalked and pencilled as for working by and, it can be readily seen how to set the re-olving head so that the iron shall fit the mould-ng, and thus passing the piece of timber over hilst the iron revolves the moulding is worked.

When this latter method is adopted, gauge nes are run on, so that if any defect occurs in ie working the moulding, it may be regulated ith a hollow or round (casement) of the required umber or outline. But, in addition, some achine men can grind the iron to work the oulding with by the veneer above stated, and etting the machine working a short piece for a mple, try the veneer to the end after it has assed through, and regulate if such is required. ll these methods are practised in different ops and in different places. The mention of ese several ways may help some either to follow originate a different method. And just a ttle in regard to the preparation of the details: ey are usually prismatic or oblong, though in

Fig 275

Scale 3

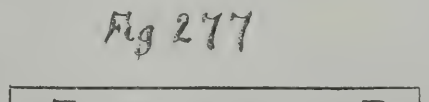
me instances they take other outlines, but in is case they are to be understood as prisms ith a square base; or, to put it more plainly, ey are square blocks of the length shown in the awing. They are first cut to the required ngth, and in cutting are allowed, say, ⅛in. nger than the finished size. Have a square it in the mitre-box, and nail a piece on the sole bottom piece inside, sufficiently far from the uare cut to suit your length; this serves for a uge. Cut a square end on the piece which as been prepared for the dentils, then push the iece along until stopped by the gauge, and cut gain; continue cutting until sufficient are cut.

Fig. 276 is introduced to show one method of etting over the difficulty which arises at the xternal angle of the dentil course or band. It ill be seen that it is by having the corner dentil n. larger each way, and rebating this out to fit ie corner of the fascia, otherwise there is seen n the right-hand side how it would occur. Of ourse, the latter, by extreme care, could be arried out; but the extra size, according to the est method, would hardly be noticed, except by practised eye. Sometimes a pine cone is carved id placed at the corner. This is a matter of ste and judgment; but to some it would not be tisfactory. Sometimes, again, a turned drop is troduced to get over the knotty point. And ill another method is to put a dentil just fair ith the angle against the front of the fascia, id another fair with the angle on the return of e entablature—that is, the two corner dentils will at right angles to each other, and the angle is ft vacant of either drop, cone or aught else. he reader and workman is left to decide which of all these ways he will take, or design a different one altogether.

When the dentils have been cut, the ends require to be planed, as one end, at least, is fully seen, and the other end is planed for sake of having them equal in length. In order to this planing, a box is made.

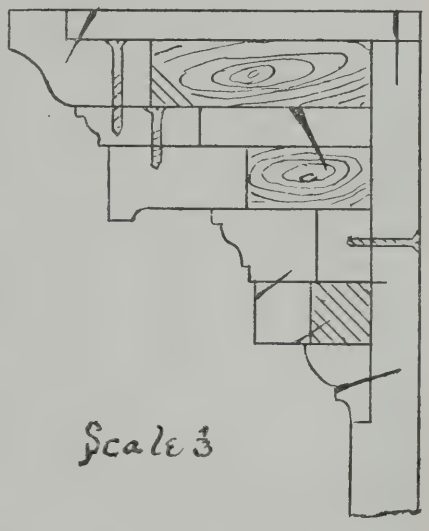
Fig. 277 shows the plan of the box required; it has neither top nor bottom—just ends and sides;

Fig 276



Scale ½

it is firmly nailed together, and the space between the sides is such as just to admit the dentil, and the distance between the ends sufficient to admit from 12 to 20 dentils, and a little extra room for wedges. It will readily be understood that the depths of the sides of this box will be a little less than the length of a dentil. Having placed in this box the dentils which are to have their ends planed, the space for the wedges is filled by driving a wedge from each side (for wedging), and thus they are tightened; now it will be readily seen that the dentils can be planed over without any risk of chipping them, providing the plane has been *set fine*, and a shaving or two taken off, say, at one end, and then reverse the end of the box and plane the ends straight through; turn the box over and perform a similar operation with the other ends of the dentils. Two of the dentils which have already had their ends planed may be used to guide the workman in planing the remaining portion of the dentils. By putting one of these at each end of the box, this will allow the joiner to plane straight through. Of course, he will only plane down to these guides without taking anything more off them.



If the box has been properly made, the square may be applied off the side across the ends of the dentils in order to see that they are all right. This being done, and all in readiness for commencing to build up the entablature, we return to consider Fig. 275. Having the fascia, or frieze, ready, and the return ends mitred as shown in Fig. 271 in the preceding article, the ovolo moulding is fastened to, after having been mitred and fitted as previously described. In case that this ovolo is to be carved with egg and dart, it is very customary to do it in position; but sometimes the lengths are marked and the carving executed before mitring and fixing, except just at the mitres, which is done after fixing. At the corner, in case of carving, the acanthus leaf usually occurs to avoid the difficulty which presents itself. The frieze, or fascia, is often

Fig 277

carved, in which case the timber in it would be much heavier to provide against the cutting and sinking required; but sometimes a carving consisting of festoons of drapery is fastened to the frieze, either with needle points and glue or screwed from the back side, the screws entering the corving at suitable points, where they will not penetrate through. The filling, or backing, piece just immediately behind the dentils may be fitted and fastened. The fitting will mainly consist in mitring at the angles, and noticing that it beds closely to the fascia. It may be fixed either by screwing from the back or nailing from the front, and it may be glued, and if special workmanship is required it may be roughened with a toothing plane on the back. The moulding immediately above the dentils may be put in position now, and when mitred can be nailed as shown, either with screws or ordinary nails; in hard wood screws are by far preferable. This moulding should form a right angle with the backing-piece of the dentils, so that there will be no difficulty in putting them in. It will be noticed that the top member or moulding of the cornice is rebated to receive a light covering board, and that a joist, ground, or packing piece is shown supporting this. Joists or packing pieces may occur at from 12in. to 16in. centre to centre, and as the return ends are rebated just as the front, no joists are required at the ends, the return rebate serving, thus indicating that the joists are to be spaced equally between the rebates. Perhaps the simplest way to prepare the top moulding (ogee) is to mitre it at the required length, and also the return ends; then glue these ends to, and allow the glue to harden, and when that has taken place put in screws from above, so as to connect the pieces forming the mitres together. These screws should be put in from the top, where they are least likely to be seen. But if the top of the entablature will be seen, as is usually the case when descending the stairs and the entablature in the hall, then recourse may be had to putting the top moulding in its place on the cornice, which has been so far prepared for it, screwing it down through the rebate to the moulding immediately below, putting in the joisting pieces, and gluing angle blocks in

Fig 278

Scale 3

between these joists, and also one at each mitre, with the grain running vertically. Then the covering board may be fitted and fastened down with fine hooks.

The method of nailing is shown in the figure. There remains the dentils to be added; if they have been prepared according to instructions, the length having been taken from the sectional elevation, the joiner should have nothing to do but just brad or needle-point them in, as each one should fit exactly the space allotted. They may have a little glue put on the back and upper end of each. The space between the dentils is usually two-thirds of the length of one of them. The method of arranging the dentils at the angles has been treated of, as also alternative treatment, to avoid difficulty. The method of fixing an over-door was shown in the preceding article, and will apply to this.

Fig. 278 gives another outline for an entablature cornice which is rather more classic. No further instructions are required to build this, seeing that all joint lines are shown. It is not intended that these outlines should give definite ideas of proportion, as that will be best learned by the study of the different styles of Classic architecture, wherein the proportion of the various parts are laid down relatively, and the spacing of the dentils. We are now ready for adding on the isosceles triangle, which constitutes the simplest outline of a pediment; other outlines will be shown also. Some sketches of the usual outlines of pediments are contained in the BUILDING NEWS of the 23rd October, taken from the prize drawings of S. K. Greenslade.

THE LOGIS BARRAULT, ANGERS.

Angers, the capital of the Plantagenets in France, is in point of historic interest without a rival among the towns of the country. Revolution spent its destructive fury upon the place in almost unique and unequalled completeness. Four churches were demolished at a blow, to be replaced by the dreariest of squares; a hideous préfecture takes the place of one of the noblest abbeys of France, and gay boulevards have been erected on the site of "the flinty ribs of this contemptuous city," the walls which play their part in Shakespeare's "King John." In spite of new faubourgs, new bridges, and new squares, Angers still retains the impress of the Middle Ages: its steep and narrow streets, its dark, tortuous alleys, the fantastic woodwork of its houses, the sombre grimness of the slate-rock out of which the city is built, defy even the gay audacity of modern fitful France to destroy the character which comes of antiquity and the past. Angers is still worthy of the city of the counts. From Geoffry Greygown to John Lackland, there is hardly one who has not left his name stamped on church or cloister, or bridge or hospital. The tombs of the later dukes, it is true, have been removed and disappeared from the cathedral; and worse still, the churches have undergone a coarse and wholesale process called "restoration," till their life and soul as historical buildings have been driven out of recognition. The new streets are in the worst of modern Parisian taste, and the gems still existing as remnants of the past are generally located in the midst of the ugliest of surroundings. Turning round behind the Tower of St. Aubin, up the Rue de Musée, the visitor will find the subject of our illustration to-day. It is the splendid Renaissance palace built by Oliver Barrault, treasurer of Brittany and thrice mayor of Angers in the years 1497, 1504, and 1505. The place is now used as a museum; but it goes by the name of its builder, *Le Logis Barrault*. On the left of the courtyard is a beautiful Gothic cloister in the Latest mode of that style. with a florid tower of great richness and quaint proportions, inclosing a spiral staircase, which terminates in a beautiful ribbed vaulting above. After the days of Barrault, his home was converted into a Séminaire, and in the time of Louis XIV. the house was enlarged. In a dark hour, from an artistic sense, the building was "restored" about 1854. The museum has three divisions: the galleries of modern poor French paintings, redeemed in the sculpture gallery by Canova's grand bust of Napoléon I.; the Musée David; and the Cabinet Turpin de Crissé. The Musée David reminds one of the Thorwaldsen Museum at Copenhagen in its character. It is filled with the originals or casts from the works of the great local sculptor, David d'Angers, whose name it bears. The casts comprise those from the noble tombs of Bonchamps at S. Florent and of Fénelon at Cambrai. Behind the museum, and entered from its garden, is the beautiful ruin of Toussaint, dating from the 12th century, a miniature Tintern, and very English in style—it was an abbey of regular canons, founded 1115 A.D.

SELECTED DESIGN FOR SOUTH KENSINGTON MUSEUM BUILDINGS.

Although we fully illustrated Mr. Aston Webb's selected design for this great national work at the time we gave illustrations of all the competition designs,* his elevations of the main façades have not yet been published. We therefore now give them among our illustrations to-day. That of the Exhibition-road front also illustrates Major-General Scott's Science Schools, a work of uncommon merit, and copiously illustrated in detail by us in the Building News for Feb. 18th, 25th, March 3rd, 17th, and 24th, 1876. We understand that Mr. Webb is now preparing the working drawings for the new buildings.

NEW PREMISES AT THE CORNER OF WIGMORE STREET, W.

This handsome block of new business buildings has been erected at the corner of Wigmore and Wimpole-streets, not far from Cavendish-square, and forms one of the most noticeable recent additions to the street-architecture of West London. The façades are in stone, and the roofs are covered with tiles. At the corner of the two thoroughfares is a shop entered at the angle. Mr. Frank L. Pearson is the architect, and our illustration is taken from his Royal Academy drawing exhibited this year.

CHURCH OF ST. ANDREW, EARLSFIELD.

This church has been built from the design of Mr. E. W. Mountford, F.R.I.B.A., whose plans were accepted, if we remember rightly, in a limited competition. The drawing given hardly does the building justice. Red brick is freely used inside as well as out, with stone shafts to the arcades. A rich wrought-iron grille divides off the morning chapel south of the chancel. We illustrated the vicarage at Earlsfield from Mr. Mountford's Academy drawing in the Building News for May 8th this year. The site for both church and vicarage was given by the governing body of Magdalen College, Oxford.

WENTWORTH HOUSE, MILL HILL.

This house has been rebuilt on the site of an older one in a well-wooded and picturesque situation. The illustration shows the garden front looking south and over the valley towards Hendon. The materials used are Lawrence's red facing bricks with terracotta dressings. The hall and dining-room have been floored and panelled in wainscot. The modelling of terracotta and the small arch of brick carving were executed by the late Mr. R. A. Ledward. The house, with stables, lodges, greenhouses, &c., has been well built by Mr. T. Nye, of Ealing, Mr. Dewey being the clerk of works. The grounds have been remodelled and laid out under the direction of Mr. Milner. Messrs. W. E. and F. Brown are the architects. The drawing shown was exhibited at this year's Royal Academy.

ELIZABETHAN FURNITURE FROM YORKSHIRE.

The fine old Bedstead shown on our sheet of furniture this week is richly carved and inlaid with marqueterie work. Like the Great Bed of Ware, there is no footboard, the posts being entirely insulated from the bed, and merely sustaining the end of the canopy over. The carved feet to the posts are worthy of remark, being of an altogether unusual character. The square bases which support the balusters are very massive, and are panelled and rudely carved on all four sides; the balusters are enriched with scroll foliage and flowers. The headpiece is panelled with arched panels peculiar to the period, inlaid with various designs, and the pilasters have crude figures carved upon them. The canopy is richly panelled and also inlaid with marqueterie, and on the top is a carved figure of a dove with oliv branch, which formerly surmounted the sound ing-board of Bradford parish church. Th stamped velvet cover and vallance belonging t the bed are dated 1580. This piece of furnitur fetched £194 at Christie's, and belonged to th Hailstone Collection, which was disposed of b that firm. The Oak Buffet, from the same source is likewise richly carved and inlaid with blac and yellow woods, the inlay in the two doors lower cupboard being especially good. Unde these are two drawers with carved fronts, an under the shelf is a drawer the whole width. I the upper portion the cupboard is splayed off either side, the projecting top at the angles bein supported by two massive balusters with Ion caps. Altogether, this buffet presented a hand some appearance, nor would those who look fo utility be disappointed, for there is no wast space inside, and the capacious cupboards ar drawers would satisfy the most exacting house keeper.

VALLE CRUCIS ABBEY.

This beautiful old Cistercian abbey was founde about the year 1200 by Madoc ap Gryffyd Maelor, lord of the neighbouring castle of Din Bran, who was buried here. There is still muc of the abbey, which is mostly of Late Earl English character, and with a little imaginatio the general scheme may be made out. The ruin of the church are the most complete, of whic the west end is very charming, having an orn mented arched doorway, over which are thr lancet-headed windows, and rose window gable; part of the monastery buildings are no used as a farmhouse. Standing as it does in th beautiful and peaceful vale of Llangollen, wi the ivy clustering about its ruined arches, ar nearly surrounded by fine old ash-trees, it is most beautiful and picturesque object. Th following lines from an old Welsh melody ref to Castle Dinas Bran, Valle Crucis Abbey, ar Eliseg's pillar, an old cross or monument stan ing in an adjoining meadow:—

I passed by thy pillar, firm rooted, to waken
Long memory of chiefs that in battle had sunk;
But the earthquake of ruin its basis had shaken,
The voice of the thunder had shattered its trunk.

I passed by thy castle, once mirthful and splendid,
Its court was too truly an emblem of thine;
I passed by thy abbey, its worship was ended,
The ivy hung dark over portal and shrine.

W. Prince.

* These competition designs will be found in the Building News for August 7, 14, 21, and 28; September 4, 11, 18, and 25; and October 2, this year.

CHIPS.

A special meeting of the town council of Burton-on-Trent was held on Wednesday to consider offer by Lord Burton to present to the Corporatio for the purpose of municipal offices and assemb rooms, of St. Paul's Institute and adjoinin premises built by his father, the late Mr. M. Bass. The gift includes the organ and fittings of th great hall, the stage and annexe, and has bee accepted with thanks. The buildings cost £40,000

At the Pro-Cathedral, Kensington, last wee the Bishop of Emmaus solemnly blessed the ne tabernacle, erected from the designs of Messr Goldie, Child, and Goldie, the contractors of th building itself, at a cost of £180. The tabernacle composed entirely of metal, the iron safe beir inclosed in a covering of brass. The work, whic has been carried out by Messrs. Hart, Son, Pear and Co., of London and Birmingham, is of La 15th-century Gothic style. Statuettes of ange with extended wings are placed to the right and le of the gable.

The organ in the City church of St. Michael' Cornhill, was reopened on Sunday after reconstru tion by Messrs. W. Hill and Son.

The Palace Hotel at Inverness has just bee opened with a house-warming dinner. It is bui of freestone, and has a frontage of over 120ft., height of five stories, and contains over 60 apar ments. It has been erected within 6½ month Mr. R. J. Macbeth being the architect, and M William Alexander the contractor.

The new north aisle of the parish church Alrewas was opened and dedicated on Wednesda week. The new work has been carried out b Mr. R. Bridgman, from the designs of Mr. Bas Champneys, of London. Before the addition w made the building consisted of a nave, south aisl and chancel; other work has been carried out, ar the total cost will be £1,600. The wall on the nort side of the nave has been carried 22ft. furth north, and arches and columns, richly moulde were constructed to carry the roof, which is carved English oak. All the old stone and o material has been utilised. The whole of the sea have been re-made, and the flooring is of Acm wood blocks, by Duffy, of London.

HE ARBITRATOR'S AWARD IN THE CARPENTERS' DISPUTE.

) INCREASE OF PAY, BUT REDUCTION OF WORKING HOURS, AND ADVANCED PAY FOR OVERTIME.

[HE arbitrator, Mr. J. MacVicar Anderson, P.R.I.B.A., in the matters in dispute be-veen the Central Association of Master uilders and the carpenters and joiners of ondon, issued his award at noon yester-ıy (Thursday). The document narrates at nsiderable length, and in some detail, the eps which had led up to the arbitration, giving :e eight points of the memorial presented the Central Master Builders' Associa-on by the United Trades Committee of ırpenters and Joiners, which were, in fect, a demand for (1) a reduction of orking time from 52½ to 47 hours per week,) an advance of wages from 9d. to 10d. per our, (3) increase of pay for overtime, (4) an lowance for expenses to men sent to a distance om the shop or job, (5) the abolition of sub-tting and piece-work, (6) the providing in shops ıd on jobs of a lock-up place for tools, (7) of a ace for meals, and (8) one hour's notice and ıe hour's wages for grinding to be allowed on scharge. These amended rules were, if con-ded, to have come into force on May 2; but ing refused by the master builders, a partial rike against three representative firms took ace, replied to on May 23 by a general lock-out. compromise was offered by the employers on ıe 27th July, but, being declined, was withdrawn ı August 6th. On Michaelmas-day the carpen-rs asked that the President of the Royal ıstitute of British Architects would arbitrate, ıd at a conference held on October 12th both des agreed to submit to Mr. Anderson's :bitration the matters in dispute. Four repre-ntatives on each side, with the respective :cretaries, attended before the arbitrator on ct. 19, 22, and 27, and on Nov. 3, and evidence as also given by representatives of the operative asons, plasterers, and bricklayers. Having eard the arguments for and against the eight oints of the memorial, the arbitrator announces ıat he has come to the following conclusions :—

As regards Clause 1, the carpenters and oiners have established a claim for consideration ı respect to the present code of working hours : ıe abnormal size of London, and the great istances which workmen have to travel, render ıe conditions of London work exceptional and ifferent from those in any other town.

As to Clause 2, the carpenters and joiners have ailed to establish their claims for an increase of ay; the depression in trade, and other con-itions which tend to the advancement of cost, eing great. The recent strike and lock-out in ondon have led to a loss from which the men ill not recover for a long period, while the ifficulty which has been experienced in getting ork done has given an impetus to foreign labour. o increase the cost of building beyond the resent limits will tend to restraint of trade, and o bring disaster on all concerned.

Regarding Clause 3, it is reasonable that over-me should be paid at a higher rate than rdinary labour; but inasmuch as overtime is ften necessary, the rate should not be pro-ibitive.

Clause 4 of the memorial has been so amended s to include men sent into the country, and is greed to.

Clause 5 (prohibitive of sub-letting and piece-ork) has not been insisted upon, and I make no ule respecting it.

The remaining three clauses have been practi-ally agreed to, subject to certain modifications, nd are embraced in my award.

On and after the date of this award (yesterday) he code of working rules for carpenters and oiners in the London district shall be—

1. The working time, both in shops and on obs, shall be 51¼ hours per week for 36 weeks in ummer, and 47 hours per week for 16 weeks in inter, equal on an average to 50 work-ng hours all the year round. The hour or commencing work to be 6.30 a.m. for the 6 summer weeks, and 7.0 a.m. for the 16 winter eeks. The hour for leaving off work on the rst five working days of the week shall be 5.15 .m. for the 36 summer weeks, and 5 p.m. for the 6 winter weeks, except in the depth of winter n outdoor jobs, when it is to be 4.30 p.m. The our for leaving off work on Saturdays to be 12 'clock noon all the year round. Half an hour) be allowed for breakfast every working day, and one hour to be allowed for dinner on each of the first five working days of the week, except in the depth of winter, when half an hour only is allowed. The sixteen weeks of winter are to be reckoned eight on each side of Christmas-day.

2. The standard rate of wages in shops and on jobs to be 9d. per hour.

3. Overtime, when worked at the request of the employer, but not otherwise, to be paid at the following rates per hour :—From 5.15 p.m. in summer, and 5 p.m. in winter until 8 p.m., one shilling per hour; from 8 p.m. until 10 p.m., one shilling and threepence per hour; from 10 p.m. till the time of starting next morning, one shilling and sixpence per hour. On Saturdays, from 12 noon until 4 p.m., one shilling per hour, and from 4 p.m. till the time of starting on Monday, one shilling and sixpence per hour. No overtime to be reckoned until the full working day has been made.

4. Men who are sent from the shop to a job, including those sent into the country, shall be allowed as expenses one shilling per day for any distance over six miles from the shop or job, exclusive of travelling expenses, and allowance for time spent in travel.

5. Employers shall provide a lock-up place on jobs where practicable, and shall take reasonable precautions for securing workmen's tools, but without incurring responsibility in case of loss.

6. Employers shall provide, both in shops and on jobs where practicable and reasonable, some suitable place for the workmen to have their meals, a labourer to be provided to prepare the same.

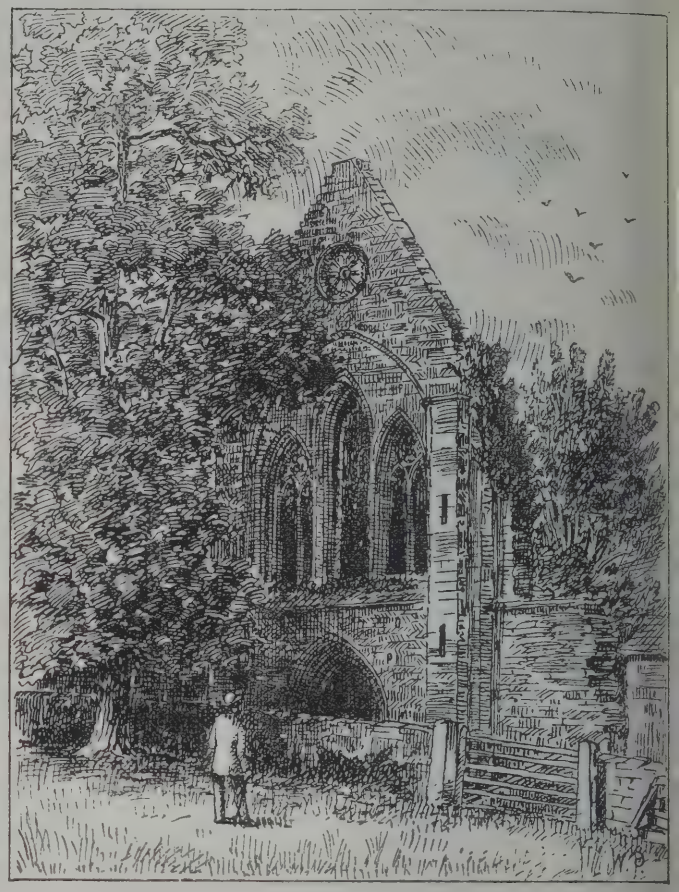
7. Men who are in receipt of full wages, and who have been employed for 49 hours in summer and 45 hours in winter shall, on discharge, receive one hour's notice, to be occupied, as far as practicable, in grinding tools, with one hour's pay in addition.

The net result of the award is a reduction in time of 5½ hours for the 16 weeks of winter months in shops, and 1¼ hours in the 36 weeks of summer months; all round, an average reduction from 52½ to 50 hours for the working week. While the rate of pay is unaltered, the rates for overtime are increased, the chief gain to the men being that of 2d. per hour for the first two hours on full days, and double time from 4 p.m. instead of 5 p.m. on Saturdays. New features are the concession of a shilling a day as "expenses" (*i.e.*, pocket-money) for men employed over six miles from the shop, the provisions of a lock-up place for tools, and of a meal-room.

The London Master Builders appear gratified with the award as a whole, but the United Trades Committee express considerable dissatisfaction. Some predict that it will lead to further agitation among the allied trades. One or two representative men, on the other hand, express themselves as willing to take the award as an advance in the direction aimed at. The principle of the reduction of hours having been conceded, they assert that an upward movement in wages will be forced by the action of the other building trades. The arbitrator's award, however unpalatable to the men in respect to wages, will, however, be loyally submitted to by all parties.

BOOKS RECEIVED.

Forty Plates on Building Construction, by CHARLES F. MITCHELL, M.S.A., M.A.A., Lecturer on Building Construction at the Polytechnic Institute, &c., assisted by the Lecturers of the latter (London: Cassell and Company).—This series of plates, which can be obtained in sets for the different trades, has been prepared to assist students studying for the examinations in the elementary, advanced, and honours stages of Building Construction and Drawing of the Science and Art Department, and for the examinations of the City and Guilds of London Institute. They will also be valuable, we think, in offices where pupils are taken, and every architect would do well to have the volume before us. One merit of the drawings is that every part and detail is figured. Mr. Mitchell has been assisted by his colleagues at the Institute at which he is lecturer. The details given of brickwork show isometrical drawings of piers from one brick to three bricks, and their footings; every alternate course of bond is clearly shown, also the damp-course of hygeian rock or asphalte. The author shows the rule of obtaining depth and width of footings and concrete. Thus the area of footings should equal $\frac{\text{Total load}}{\text{Safe load on concrete}}$. Plates 2, 3, and 4 give varieties of English and Flemish bond, illustrated by large-scale plans of courses for walls at right angles, showing the closers at angle and stopped ends, from one brick to three bricks in thickness. Single Flemish bond, details of brick arches of various forms, chimney showing the arrangement of flues are given, these plates being revised by Mr. H. W. Richards' lecture on brickwork and masonry. The stone walls illustrated give uncoursed random rubble, coursed rubble, irregular course or "snecked" walls, besides squared rubble in courses, block-in-course, and ashlar walls with brick or rubble backing. Joggles, slate and metal cramping, are also indicated. Stone staircases are fully detailed and figured, in which the steps and landings and the rebated back-joints of the steps are shown. Modes of tailing steps supported on walls, joggled landings, and soffits flush and broken are detailed. In the carpentry section plans of single floors showing fireplace, trimming, methods of jointing floor-boards; plans and details of double-framed floors with wood and iron binders appear. Roofs and partitions with details and stress diagrams; a Mansard roof truss for a 30ft. span, with perspective sketches, are useful. Passing joiner's work, which has been revised by Mr. G. C. Pope, and is well done, we come to very useful details of plumbers' work, on which ridge rolls, flashing, lead flats, secret gutters, methods of securing lead to brickwork, stepped flashings to chimneys, are clearly shown. Iron construction of every kind, with figured details, drawn to a working scale of iron truss of 40ft. span, calculated by the author, and revised by Prof. H. J. Spooner, is very fully illustrated, and also girders to carry a distributed load of 25 tons, and drawings of a small town residence, showing a complete set of drawings, illustrating fire-resisting construction and sanitary details complete, making a work as completely illustrative of elementary construction as it is possible to be. Every student should have a copy.——*The Practical Telephone Handbook*, by JOSEPH POOLE, chief electrician to the late Lancashire and Cheshire Telephonic Exchange Co., Manchester, with 227 illustrations (London: Whittaker and Co.)—As a manual of moderate cost, this little book will be found to be fairly complete and practical. The author has studied the requirements of telephone *employés*, and for users of that instrument, as well as all who wish to obtain detailed information of the various forms of receivers and transmitters in use, and the different exchange systems, the manual before us is well suited. The illustrations are numerous and well drawn, and show every kind of apparatus, transmitters and receivers, batteries, signalling instruments, the chief kinds of switches and switch-boards; also the out of-door structures, such as standards for carrying the wires, trussed standards and arms, means for regulating the sag of the wires, and the systems in use known as the "twist" and "cross" systems for arranging the wires. The student of electrical appliances will find much general information on the theory and history of the subject of telephony in this little work.



Councillor J. B. Corby, architect, Stamford, was on the 4th inst. duly elected a Fellow of the Surveyors' Institution.

A Methodist New Connection Sunday-school a Deighton, near Huddersfield, was opened on Thurs day in last week. It provides in the assembly-hal seats for 400 scholars; in addition there are five classrooms. Mr. J. Brooke, of Hindley, executed the masonry, and Mr. D. Light, of Cowcliffe, tho joinery.

To celebrate the opening of the new free reading-room at the Hampstead public library, a conversazione was held on Wednesday week at the library, Stanfield House, High-street. The room has been erected as a memorial, and was built by Messrs. Burford and Son, of High-street, from the designs of Mr. Horace Field, of Church-row, Hampstead.

Messrs. E. Miller and Co., Limited, Leeds, have had placed in front of their premises at the bottom of New Briggate, near the public dispensary, Leeds, a large illuminated clock, made and fixed by Messrs. Wm. Potts and Sons, clock manufacturers, Guildford-street and Cookridge-street, Leeds, makers of the Royal Exchange, Thornton Arcade, and New Arcade clocks, Leeds.

WAYSIDE NOTES.

N a former occasion, when the battle of Profession v. Art was raging pretty violently, ggested that those parties who signed the orial to the Institute, together with such rs as hold similar opinions, should form iselves into a new society, where they might ast find consolation for the present times manners in sympathetic lamentations *inter* I must really be excused for again putting ard the suggestion. Why waste energies in e condemnation of the average mortal archi- If he is actually the contemptible creature the velvet-coat fraternity would have the ic believe, his methods and procedures must y be beneath criticism. It is a thousand s that gentlemen of such consummate skill e "artist-architects" should expend any of invaluable time in endeavours to sit upon oor, plodding practitioner, when they might te the same to the production of even a small nent of their high architecture. Far better d it be if they shook the dust in which the e-named poor, plodding architect grovels their feet for ever, and, renouncing all ing architectural societies, band themselves her with the strength of their own self- eousness, thanking the Lord that they are s other men, and looking hopefully to a day generation for the lost sheep.

---

is true that some difficulty presents itself regard to the name and title of such a ty. The works of its members being of such homable architectonic excellence, how shall le sufficiently describe their lofty standard? mere demonination "architect" is manifestly ficient; nor would the resort to the proiation of the first syllable as in "arch," or ervant-girl's "arshitect," help in any way, ting, perhaps, that the domestic in question d be enabled to announce, with more natural ing dignity, the arrival of the great man. "artist-architect" sounds like a contra- on in terms; and, again, "art-architect" is ide, uncouth piece of verbosity altogether ing in euphony, and seeming to claim some of relationship with the "bogie-man." I mewhat distressed to find how little I can in this way. "Architectette" suggests as something to distinguish what is refined what is commonplace. Thus we should "the *Fin-de-Siècle* Society of Ethereal itectettes," an improvement, I own, on suggestions, yet still far from satisfactory, ng, as this title does, broad vowel sounds. rtheless, it would doubtless impress the c. I can imagine the client catching sight e report of a meeting of a body so named on reliminary morning glances at the paper, hen eating his breakfast in a thoughtful e that would go far to show that he had impressed indeed.

---

eally thought that as a working phrase the ng, "Architecture—a Profession or an " was played out long ago; but here we it again in the columns of the *Times* cropping e a jack-in-the-box, looking fresher than and tempting the pen of many a trenchant r, *pro* and *con.*, as do all titles of subjects ing positive opinions from antagonistic s of view. The title is catchy, and not iently plain and straightforward. It lacks an t expression, open though its countenance appear at first sight. It affords every y for unknowingly arguing the same thing, for playing at cross-purposes. Writers d first give an amplification of the title as interpret its meaning. It would be far to adopt some such title in discussions of ature as, "Can the knowledge of an archi- e tested by examination?" or "What are ualifications of a true architect?" Taking tter as the subject of debate, I should be ed to think that, according to many, an ensable attribute is *conceit*, and to the t of some 99 per cent. of the sum total of ments required.

---

is easy to see that the present discussion eave matters in dispute in exactly the same on as before. The "art" men—to give the utmost consideration—look at things in culiar light; the "profession" party commonsense on their side, and con- ntly the result of the discussion can be g more satisfactory than an agreement to differ. The matter in dispute being, by the very nature of the heading of the discussion, so very vague, it will be as difficult to say what the disagreement is about as to define the exact limits of the area whereon agreement might be supposed to be possible. Anyone will find that he can enter this discussion and write himself black in the face in support of either party. So long as individual prejudice, taste, and sentiment guide the opinions expressed, an apparently logical deduction can be made in any direction. It is only when we stand out of ourselves—so to speak—and take up a position on the secure basis of commonsense, and have consideration for the practical interests at stake, that we are enabled to see the question in its proper light. Facing the problem somewhat in the spirit of a Carlyle, we shall surely see that while on the one hand we have all that is human and concrete, on the other we have empty abstraction and consummate selfishness.

The Rev. R. H. Morris, D.D., Prebendary of St. David's Cathedral, writes in a daily respecting the condition of an interesting old building—Llangwyfan Church, in Anglesey, which stands on a small island, and was formerly approached from the mainland by a causeway. The church occupies the entire surface of the island, which is only 12ft. above the shore, and is thus exposed to the gales and tides that are rapidly destroying it and continually washing away bones from the graves. The church itself is now roofless; but Mr. Morris says that the walls are generally in good condition, and require but small repair. It is proposed to protect the building with new slates, repair the existing roof-timbers, and fill up the cracks in the walls. Further, a sea-wall round the island would protect it against the destructive effect of boisterous winter gales. The church is 15th century, with a certain portion of much earlier date, and at present consists only of one single aisle, with an arcade of three arches in the north wall, now, however, built up. The work of repairing this old building, which in its romantic position should be worth preservation, would not cost a great deal, seeing how small are the remains; so I trust the friends of the building will be successful in their efforts to raise the requisite funds. It would also be a good work to construct the sea-wall, and thus prevent the ultimate complete destruction of the church, after the same manner as so many of the grand East Anglian churches have been destroyed.

I notice that a large elm in front of St. Paul's Cray Church has been snapped in the recent gale, and narrowly escaped doing a large amount of damage to the building. As it is, it has knocked away a lot of the masonry in the buttress on the north of the famous Early English west doorway. The tree was a monster; where it has been broken off some 6ft. from the ground, it appears to be over 5ft. in diameter. Fortunately, it fell to the north of the church; had it been 10ft. more towards the south, it must have much injured the old building. Trees do not give one a great idea of weight in their natural state. It is a different matter when they fall. So with a horse: he does not look immensely weighty, but when he treads on your toe, your thoughts are, for the moment, directed from their erstwhile channel.

A new underground railway is proposed from Waterloo Station to Baker-street, passing under the Thames on the west side of Hungerford-bridge, and thence proceeding under Northumberland-avenue, Trafalgar-square, Haymarket, Piccadilly-circus, Regent-street, Regent-circus, and Portland-place. Is this to be the connecting link between the M.S.L. Railway and the South-Eastern? I understand that Sir Edward Watkin is anxious to provide a through route from the North of England to the Straits of Dover, and, perhaps, some day through the Channel Tunnel, whence the long-mooted four C.'s railway—Calais, Constantinople, Calcutta, and Canton—will carry one towards the rising sun. The Manchester, Sheffield, and Lincolnshire extension Bill is to be pushed forward next year, and may get through: it seems chiefly a matter of the selection of a suitable site for the London terminus. The proposed Waterloo and Baker-street line reminds me of my own suggestion as to a light railway from Charing Cross to the north of London. When will some enterprising engineer or company-promoter pull this through? It would surely pay amazingly well if properly carried out, with stations at Oxford-street and Euston-road, and such others in Kentish and Camden Towns and Hampstead and Highgate as might appear desirable in planning the railway. It seems an opportunity for some such undertaking as that of the City and South London Railway Company. GOTH.

CHARING CROSS NEW CONVALESCENT HOSPITAL.

AT the Triennial Festival dinner of Charing Cross Hospital, on Tuesday evening, the Lord Mayor, who was in the chair, said that recently a five-acre site for a convalescent home had been procured at Clacton-on-Sea. In furtherance of that desirable object they had received a munificent gift from Mr. Passmore Edwards. (Loud cheers.) When such donations were made, it showed that the age of philanthropy was not a thing of the past, but continued to this day. (Cheers.) The Lord Mayor then read the following letter:—

"London, Nov. 16, 1891.

"My Dear Sir,—I beg to thank you for the kind invitation to the Charing Cross Triennial Dinner on the 17th inst., which I am unable to accept. I have good reason to know the great good the hospital is doing, and that it is a permanent blessing to Central London, and in fact to the public in general.

"I also know what a pressing need there is for a convalescent home in connection with the hospital. I have consequently watched with interest and anxiety the efforts made for some time past to secure such a home, and have been a little surprised at the slow progress made towards its attainment.

"I therefore ask the privilege to be allowed to build and furnish, solely at my own expense, a convalescent home, with accommodation for fifty beds; and I beg, as an earnest of my intention, to inclose a cheque for five thousand pounds (£5,000), and I hereby undertake to give a cheque for the remainder of the estimated cost of the home when its foundation stone is laid.

"The only condition I attach to the gift is that the home shall remain in perpetuity under the control of the Governors and the Council of Charing Cross Hospital.

"I venture to hope that my subscription will in no way prevent the flow of other subscriptions towards the contemplated home, as such subscriptions might, subject to the discretion of the council, go to the formation of an endowment fund for future use.—I remain, my dear Sir, yours very truly,

"(Signed) J. PASSMORE EDWARDS."

The reading was frequently interrupted by loud cheers. The Lord Mayor added that he believed such a gift would not block others from giving, but would rather act as an incentive.

We have reason to believe that the proposed convalescent hospital will cost not far from double the amount of Mr. Passmore Edwards's cheque, the whole of which he will of course defray. Mr. H. Saxon Snell will probably be the architect of the building.

CHIPS.

The well-known decorative artist, M. P. V. Galland, who has of late years occupied the post of director of the State manufactories of Gobelins, has sent in his resignation.

The Hampstead, St. Pancras, and Charing Cross Railway has notified its intention of seeking powers next Session to construct an underground railway from Hampstead to Charing Cross, the line of route closely following the main thoroughfares between Charing Cross and the north-western suburb—viz., Tottenham-court-road, Hampstead-road, Camden Town, and Haverstock-hill.

A new mission church at Openwood-gate, near Belper, was opened on Monday by the Bishop of Southwell. The building, which will accommodate 250 worshippers, is in the Early English style, and it has been dedicated to St. Mark the Evangelist. The outside walls are of coursed rock-faced stone, with quoins and window jambs. The woodwork inside is composed entirely of red deal, relieved by courses of white bricks. Some of the side windows were taken from St. Peter's Church, at Belper, when it was restored. The entire cost has amounted to about £1,100. Mr. Maurice Hunter, A.M.I.C.E., Belper, is the architect, and the contractor is Mr. L. T. Wildgoose, of Matlock Bank.

Cavendish House, on the Promenade at Cheltenham, has just been reconstructed in the Italian Renaissance style for a business firm. Mr. G. W. Sadler, of Cheltenham, was the architect, and Mr. Thomas Collins, of Tewkesbury, the contractor.

At a meeting of the Shardlow rural sanitary authority held on Monday, a report as to the water boring operations in progress for the supply of Long Eaton was read from Mr. G. Hodson, of Loughborough, the engineer. He stated that the supply was of good volume, and was being derived from the millstone grit rock at a level of about 20ft. above that of the river Trent.

rebate (or "joggle," as it is sometimes loosely ed) in this case is superfluous, being, in , one of those things which sometimes tinue to be repeated for want of thought. presence in the semi-arch is still more of order with a knowledge of the well- own principles upon which the construction the arch is based. An enlarged arch block n Fig. 11 is shown in isometric by Fig. 12. outer edges of the beds are in the lines of ii, with the remaining surfaces sunk back

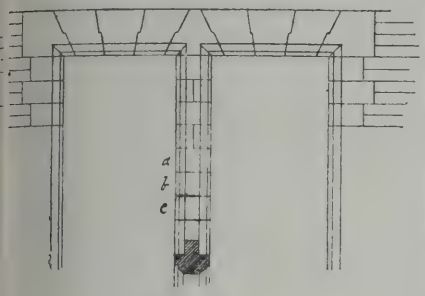

Fig. 13.

, or more, forming what is known as "panel s," these panel ends being the same to terra- a as the "chipping joints" or fillets are to structional cast-iron work—*i.e.*, to admit of e and accurate fitting by the removal of tions here and there if found necessary. The el ends also play an important part in the ng, being receptacles for grout, which, when

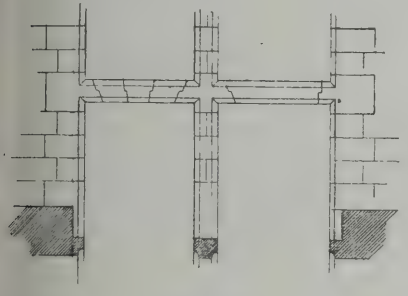

Fig. 14.

acts as a plug or dowel between every two secutive blocks in the same course.

Fig. 13, a two-light window with terracotta ssings. Mullions of the kind here shown are en produced devoid of all vertical jointing, ng so many single blocks piled one on top of other, from sill to springing, as at *a*, *b*, *c*, h the inevitable result that what should

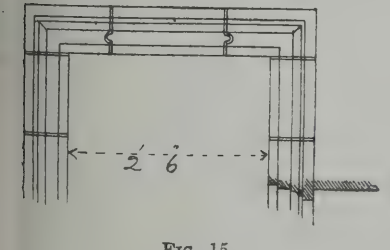

Fig. 15.

pear as perpendicular straight lines are any- ng but straight or pleasing, the fixer having latitude to "humour" or adjust the members lines, and so, in a measure, overcome the rind" or "twist" of the blocks, as well as difference in widths resulting from in- alities of tempering and firing. Where the lth of the mullion will admit, each course uld be in two pieces, rather than in one, and alternately, as shown on the upper portion the mullion. It is an old saying amongst rs, that a piece of work "split up" into three ces can be fixed more truly than when in two ces. This, though true, must be received with qualification. Fig. 14, part of a four-light dow, showing two kinds of rebate, or joggle- ting. As there is no weight to be carried ond that of the transom itself, the jointing is nere matter of taste. The slanting joints should radiate from a common point—the apex of an inverted Gothic arch whose radius is equal to the width of the light or opening. Fig. 15: trabeated door or window-head, with architrave moulding carried round and jointed with a beaded

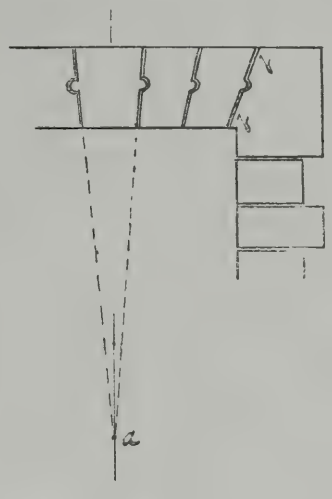

Fig. 16.

joggle. The bead is made to project from the end of the block from 1¼in. to 2in. The construction is suited only to narrow openings.

Fig. 16, flat arch, with beaded joggle-joint. The joints in terracotta are either rebate, joggle, butt, or lip-joints. The lip-joint is

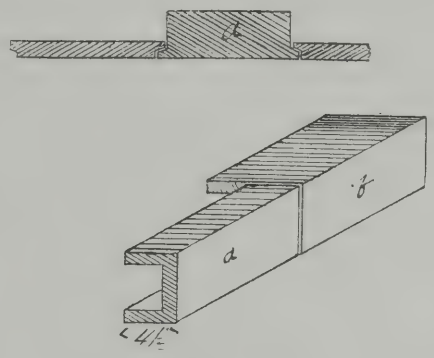

Fig. 17.

shown by Fig. 17. It is seldom used now, but was much in vogue at one time, when terracotta was looked upon as a system of veneering rather than as a material capable of the most artistic and constructional treatment, as is now everywhere evidenced around us. The middle block *a* was

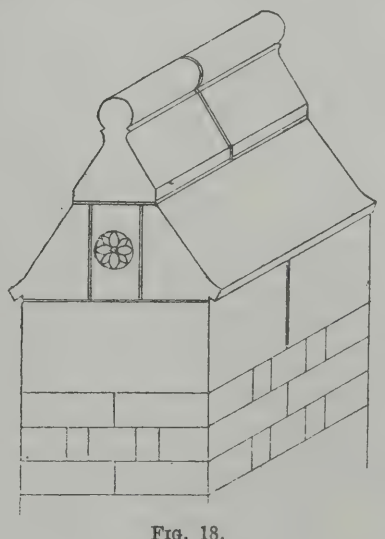

Fig. 18.

used as a bonder in ashlar work. Fig. 17, *a b*, two pieces of ashlar, pressed through a "die," as explained in Article IV., which is the cheapest mode of production, there being no moulds to make other than the "die." These blocks (and all blocks in terracotta, whether pressed or moulded—*i.e.*, made in moulds) should be of such widths on their beds as to properly bond into the wall. Where this is not done, the bond of the walls is very much broken up, besides entailing a wasteful expenditure of time and material in the course of "backing up" the terracotta. The beds should be brick in sizes of 4½in. or 9in. These blocks in the ordinary course would be filled in with a mixture of cokebreeze and Portland cement, in the proportion of 10 of breeze to 1 of cement, some three or four days prior to using them. Sometimes common soda, in the proportion of 1lb. of soda to 10 gallons of water, is used to mix up this material, for the purpose of accelerating the setting. This should not be done, as it reduces the ultimate strength of the cement. The proportion of cement, though small, is enough, as the expansive power of the cement—especially newly-manufactured cement—has to be guarded against: otherwise the blocks may be cracked. Figs. 18 and 19 show two different methods of "splitting

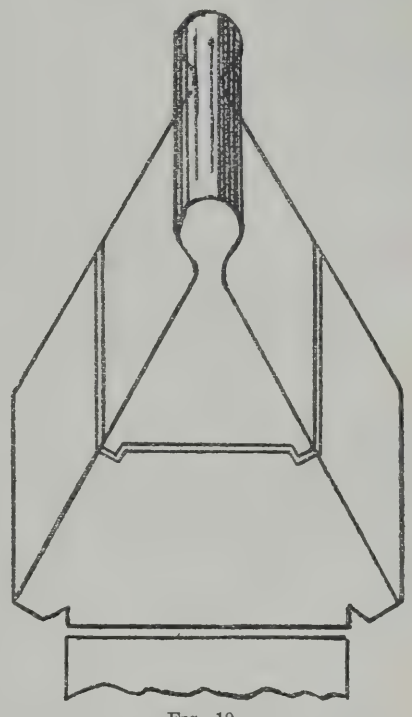

Fig. 19.

up" or jointing pier-caps, the upper portion of Fig. 19 being rebated into the lower portion, while Fig. 18 is made up of butt-joints, and having eight separate pieces of terracotta. The end piece, with the patera impressed thereon, would be from 1¼in. to 1½in. thick, and would, tile-like, be let into the space between the two side-pieces shown, throated, the blocks being "loaded" with breeze concrete, compacted by ramming. The next article will be on Sections.

THE PLACE OF CALIGRAPHY IN PERSIAN ART.

MAJOR-GENERAL SIR R. MURDOCH SMITH, Director of the Edinburgh Museum of Science and Art, delivered last week the opening lecture of the session of the Edinburgh branch of the British Typographia. Mr. Archibald Constable, honorary president, introduced the lecturer. The subject of the lecture was "The Place of Caligraphy in Persian Art," and the lecturer pointed out, to begin with, that printing from movable types was hardly, if at all, known in Persia. They were, however, the greatest adepts in the world in the nearly allied art of caligraphy, which was regarded among them as one of the fine arts. He showed how the development of Persian art was exhibited in the architecture of the country, and how it had accommodated itself to the limited materials at the builder's command. The material for the most part at the command of the builder was sun-dried brick, and the feature of the architecture was the niching of the walls within and without, the use of stalactite-like pendants to ornament these niches, the ornamental arrangement of the brickwork, specially the indenting of the walls to

give the effect of light and shade, and the riveting of the wall surfaces with ornamental wall tiles of mosaics. Some of the features of Oriental architecture imitated in this country and attributed to the Moors was, the lecturer said, really Persian in its origin. It was in the mosaic word decoration of wall that the use of caligraphy came in, and it served the double purpose of ornamentation and the inculcation of good precepts. The lecturer exhibited examples of this style of decoration on the spandrels of arches, and of lintels and posts of gateways. In the same way he showed how the use of caligraphy entered into the ornamental scheme of tile work, and earthenware generally, textiles, and metal work, and he exhibited examples of each, mostly belonging to old Persian art, in which caligraphy for decorative purposes was beautifully applied in varied ways. Islamism, in prohibiting anything which might be described as an image in Persian decoration had exercised a limiting influence on the art of the country, but the inventiveness of the people had enabled them either to evade the Koranic injunction—of which amusing examples were given—or had found an outlet in other directions. Every conceivable material had been pressed into the service of art, and he thought it might safely be said that it had touched nothing which it had not adorned. Perhaps no other race had shown greater originality in artistic faculty, and certainly none had exercised it through such a long succession of centuries. In many of our arts and industries in this country we were at the present moment either modifying or reproducing, consciously or unconsciously, designs which long ago emanated from the fertile imagination of our distant kinsmen of Iran.

TECHNICAL EDUCATION OF PLUMBERS.

IN reporting on the results of the examinations held during the year by the City and Guilds of London Institute, the Council of the Institute state: "There has been no break in the continuous increase in the number of candidates in 'Plumbers' work.' The failures in this subject are always large; but the percentage this year is slightly lower, being 56·7 as compared with 59 in 1890. The practical examination in plumbers' work was held in twenty provincial and three London centres. Of the 684 candidates, 200 presented themselves for the practical test, of whom 97 satisfied the examiner. Last year 163 presented themselves, and 36 passed. Of the 97 successful candidates this year, four failed to present themselves for the written examination, and are not qualified for a certificate. Of the 97 candidates who passed the practical test, 52 passed also in the written examination, and are qualified for certificates. The corresponding number last year was 23."

These figures show that of the large number (684) of candidates who attended the classes, only 52 succeeded in passing the full examination in practical and theoretical plumbing. But the figures also show a slight increase over the average for the previous year, pointing to the fact that the instruction given is slowly but surely effecting the object in view—viz., improving the education of plumbers.

The Mayor of Newcastle-on-Tyne presided, on Monday evening, at an influential public meeting, held in that town under the auspices of the North of England District Council for the National Registration of Plumbers. Among those present were Alderman Head, Dr. Garnett (principal of Durham College), Councillor Armour, and the clerk of the Plumbers' Company, London. The mayor laid particular stress on the folly of householders and others adopting a cheese-paring policy in regard to plumbers' work. What was saved in the plumber's bill was multiplied and added on to the doctor's bill. A few shillings saved in the former often caused death, or serious illness which sapped the constitution and unfitted the sufferers for the battle of life.

The following resolutions were passed:—"That this meeting memorialise the local authorities to consider the operation of the Technical Education Acts in the counties of Northumberland, Durham, Cumberland, Westmoreland, and the North Riding of Yorkshire, with reference to the Technical Education of Plumbers."

"That this meeting, having considered the terms of the resolution passed at the recent Congress of Hygiene, on the proposal to organise the training and Registration of Plumbers, adopt the same, and instruct the secretary to send a copy of the resolution to the members of Parliament of the district, and to the President of the Local Government Board."

SANITARY APPLIANCES AND FITTINGS.

MESSRS. GEORGE FARMILOE and SONS, of 34, St. John-street, West Smithfield, has sent us a copy of their new general catalogue, which embraces sanitary fittings, lead-work, stained and plate-glass, and various requirements of the building trades. The volume is handsomely bound in cloth, and contains over 700 pages of engravings and prices. We can only glance over the chief objects of this volume. The "Water Lily" closet is unique; it has a good water-seal in trap, while the latter is very small in cross section—a desirable condition for limited flushes. It is also so formed as to give a quick scour to the flush. These closets are made as pedestal closets, and in white, ivory, and other colours. George Farmiloe and Sons' "Smithfield" flush-out closet makes also an admirable pedestal arrangement with fluted base, varying in price from 35s. to 45s. Various other patterns of flush-out closets are illustrated, among them the firm's "Ivyite" closet in one piece of earthenware, with tinted ivy-leaf ornamentation; Jennings' closets, as the "economic" flush-out and the "pedestal vase"; Doulton's closets, as the "Lambeth patent pedestal combination flush-out"; Hellyer's closets, Pearson's, Tylor's, and other improved valve arrangements, notably George Farmiloe and Sons' elastic valve closet, with flushing-rim basin and crank to work waste preventer. Farmiloe and Sons' self-lifting "closet seat" is a simple gravity adjustment. Architects who are specifying closet apparatus cannot do better than consult the pages of Messrs. Farmiloe's catalogue, as each type of closet in the market is illustrated and priced, and the extras given. Closet basins or hoppers are also added. In the list of sanitary appliances we notice Adams's latrine, an automatic flushing arrangement; we have before described his "Trough" closet. Apparatus and fittings, such as lead traps, closet handles, waste-preventing valves, are given in detail. Several good forms of siphon cisterns, including Farmiloe's registered "Wave" siphon waste-preventing cistern and "whirlpool" are illustrated. Cheap cast and wrought-iron cisterns, baths of cast iron and of various designs, tinned-iron baths, water-heaters, and bath fittings occupy several pages. The patented lavatories suitable for every class of house and office and their fittings are worth notice. Sinks of stoneware and porcelain, and for various uses, and traps of every improved type, including those of the best patentees, are here catalogued. All the very best ventilators, including Boyle's, Kershaw's, Banner's, Hellyer's, are illustrated. Pipes of cast iron for soil-pipes, pipe-joints, drain-testing apparatus; a varied assortment of the best made "bib" and stop cocks, roundway steam and screw-down cocks, the School Board pattern variety included; plumbers' brass-work; pumps and fittings for different purposes; hot-water fittings; chimney cowls of various patterns; galvanised sheets, curved and corrugated, for roofs; stable fittings, speaking-tubes and fittings, &c., are among the articles to be found in this book. The list of oil-colours, dry and ground in oils, whitelead, &c., and the coloured designs of "brilliant-cut" and embossed glass, adapted for windows, skylights, panels, &c.; also the leaded-light designs in colours, of which there are several plates of patterns, will be found of much value to architects and others. We also find examples of wrought-iron casements and frames, sliding sashes of copper in gunmetal frames, and moulded bars. A copious index is appended. A copy of this comprehensive catalogue of sanitary appliances, fittings, and glass ought to be in the hands of every architect and builder.

A pulpit, designed by Sir Arthur Blomfield, has been placed in the parish church of Burghclere, near Newbury, as a memorial of the late Earl of Carnarvon, who built the church and adjacent rectory. The old church at Burghclere, which stands at the further end of the parish, contains the remains of Lord Carnarvon's ancestors.

Building Intelligence.

BISHOPSTOKE.—To meet the requirements the South-Western Railway employés, a n church has been built at Bishopstoke to repl the plain, ivy-clad stone structure opened 1825. The first section of the new buildi which occupies a more central site than the ol one, has cost £4,150. It has been designed the style of English Fourteenth-Century Goth Externally it is faced with snapped flints fr the Reading chalk-pits, the quoins and dressi being of Bath stone. Internally the walls plastered over a brick face. There is one ai on the south side, vestries and organ-chamber the north side of the chancel, and a small ba tistery at the west end of the aisle. A squa tower is intended to be built eventually at t west end of the nave, the walls of the structu being carried up for the present only to the t of the plinth-course. The chancel roof is ceil with boards and divided into panels with mould ribs; the nave and aisle roofs are open-timbere The roof is covered with red tiles. The dime sions of the nave are 60ft. by 25ft.; chanc 36ft. by 20ft.; aisle, 10ft. by 6ft. The tower to be 21ft. square, and its total height 58 Messrs. Wheeler Bros., of Reading, were t builders, and Mr. E. P. Warren, of Londo the architect.

PORTHLEVEN.—The parish church of St. Ba tholomew in this distant Cornish village, o built some fifty years ago, has just been resto by Mr. G. H. Fellowes-Prynne, A.R.I.B.A architect, of Queen Ann's Gate, S.W., a sum something like £2,000 having been spent there The roofs and walls have been overhauled, a interior walls replastered. A new vestry, w organ-chamber over, has been built, and a n baptistery added. The pews and wood floori have been removed, and the passages paved w encaustic tiles and the remainder of the chu with new blocks. Chairs are used. The chan floor has been extended, laid with encaustic til and a new oak altar is placed in the sanctua which is raised by several polished marble ste The stalls are massive, and of carved oak. T building is heated by hot water. The chan fittings are by Messrs. Harry Hems and Sons, Exeter. The rest of the work has been execu by local labour.

ROMSEY.—In the abbey church a very ha some pulpit of carved oak, and designed by I Ewan Christian, architect to the Ecclesiasti Commissioners, has just been erected in memor the late Mr. R. G. Linzee, a former churc warden. It is 7ft. 4in. high, and 8ft. in dia and has been made by Mr. George Wheel jun., of Romsey, the statuettes that occur in panels around the body of the pulpit being fr the studios of Mr. Harry Hems, of Exeter.

SOUTHPORT.—On Sunday, at St. Andre Church, Southport, there were unveiled a se of mural paintings executed upon the spandr of the north and south walls of the nave, a also over the archway to the chancel. Th represent, on the north side, Isaiah, Jeremi Ezekiel, and Daniel, upon the south the F Evangelists, and over the chancel archang with censers. Twelve months ago, competit designs were invited, and those of Mr. Reub Bennett, of Liverpool, were untimately select Mr. Frederick Shields, of London, was the upon engaged to prepare a series of designs the spandrels, and Mr. W. E. F. Britten execute them. The figures upon the east w were intrusted to Mr. Hiller, and the gene scheme of accessory decorations to Mr. Har Bennett. It is the first instance in this distr of mural painting on so important a scale be adopted. The general scheme of decoration b to roofs and walls is of cream colour embellish by symbolic ornamentation. Mr. J. F. Doy architect, of Liverpool, has supervised the wo

Colonel J. O. Hasted, R.E., an inspector of Local Government Board, held an inquiry at W stanton, on Friday, with reference to an applica by the rural sanitary authority for sanction to ra upon loan, the sums of £1,340 and £660 for wo of sewerage and sewage disposal for the spe drainage districts of Chatterley and Wolstan respectively. Mr. G. B. Ford, surveyor to authority, explained the scheme, which he s proposed to deal with Port Hill and New-str Wolstanton, and Longbridge Hayes and Pear T Hollow, in Chatterley.

COMPETITIONS.

ORK COURTHOUSE RESTORATION.—A meeting he Joint County and City Committee was l on the 10th inst. to consider the accepted as for the restoration of the courthouse ently burnt out. The committee agreed that . Hill's plans (subject to certain slight lifications) should be adopted as those upon ch builders' tenders should be invited, and author was instructed to prepare the neces- working and detail drawings, specification, conditions of contract, upon which tenders d be advertised for, Mr. Hill being satisfied the work can be done within the limit of ,000 expenditure; but in the event of a satis- ory tender not being obtained within that t, the committee not necessarily to be bound arry out his design. It was agreed that in event of his design being carried out Mr. should be paid the usual 5 per cent. on the enditure, less the amount of the premium 0) awarded to him.

INCHLEY ROAD, N.W.—Messrs. Spalding and ss have obtained the first place in the competi- for building a Congregational church ad- ing Hackney College in the Finchley-road, r plans for the church and school hall having selected almost unanimously by the com- tee.

LDBURY.—The plans which took the first prize red by the Oldbury Local Board, for the best me for improvements and extensions at the ay sewage works, were submitted by Mr. B. holls, of Birmingham.

RETORIA, SOUTH AFRICA.—We are informed the important architectural competition for new National Bank, Pretoria, has been ntly decided, and that the plans sent in by firm of Messrs. Frank Emley and Frank t, architects, Pretoria, have been placed first.

CHIPS.

vestry meeting was held at Sutton, Surrey, on rsday in last week, when plans by Sir Arthur nfield for the restoration of the parish church e adopted.

he new Whitehill Public School, erected by the sgow School Board, was opened on Monday. school is at the corner of Whitehill-street and ay Drive, Dennistone, and is rectangular in , having a central hall with galleries, into which y classroom opens. Accommodation is provided ,020 scholars in three departments. The build- which cost £15,050 (exclusive of the site, which £2,205), is plain in style, having a basement of ar, and upper stories of coursers with ashlar sings. The school has been constructed from plans of Mr. W. F. Salmon, F.R.I.B.A., of ncockle red freestone.

he London County Council agreed on Tuesday contribute £50,000 towards the purchase of kney marshes, 337 acres in extent. An intima- was received from the Board of Trade that saw no reason for withholding the approval d for by the Council to the purchase of ways. The Council also resolved to seek Par- entary powers to arrange with the Trustees of coln's Inn-fields for the transfer of the gardens he Council.

r. Joseph Baxter, of Walsall, for many years large way of business as a builder in Park- et in that town, died last week, aged 88 years.

r. Samuel Forbes Downing, B.A., Trin. Coll., blin, the principal of the Civil Engineering ege at Seebpore, Calcutta, died on October 16 Joomer, Madras, in the 48th year of his age.

t last week's meeting of the London School rd a very long annual report was presented by chairman of the Works Committee, the first of kind brought up by this committee. The chair- stated that the cost of repairs to the schools ing the year amounted to £67,285. As to the k of the land surveyor, during last year claims e received for £94,728; they were settled for ,259. Other settlements without claims were le to the extent of £37,605, and several claims e altogether disposed of.

ew schools are in course of erection for the leshill School Board, at Eccleshill. Messrs. dall and Bakes, of Leeds, are the architects, Messrs. S. Hobson and Son, of Idle, are the ders.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—The annual conversazione of this association was held at Edgbaston Assembly Rooms this week. The rooms and stage were tastefully decorated, and a number of architectural drawings, sketches, and photographs were exhibited by Messrs. Aston Webb, E. Ingress Bell, J. E. Collcutt, W. Emerson, W. Millard, Ernest George, E. J. May, Phené Spiers, and E. W. Mountford, of London; Messrs. Bidlake, Osborne, Newton, and Bateman, of Birmingham. Especial mention might be made of Mr. Middleton's fine collection of 100 photographs of Warwickshire churches, and Mrs. Willis contributed some interesting specimens of church furniture.

MANCHESTER ARCHITECTURAL ASSOCIATION.—For some time it has been considered that the interests of the architectural profession in Manchester would be better promoted by being represented by one body. This having been accomplished by nearly the whole of the members (a little under one hundred persons) of the Manchester Architectural Association joining the Manchester Society of Architects, a special general meeting was held at the Diocesan Buildings on Tuesday, Mr. J. D. Mould, vice-president, in the chair, for the purpose of presenting the prizes, passing the reports of the last session, and the following resolutions:—"It is here resolved that the library, book-case, and all other property of the Association be presented to the newly-constructed Manchester Society of Architects." "That satisfactory arrangements having been made for the fusion of this Association with the Manchester Society of Architects, the Manchester Architectural Association be, and is, hereby dissolved."

ROYAL SOCIETY OF ANTIQUARIES OF IRELAND.—A large number of the members of the Royal Society of the Antiquaries of Ireland assembled at the Royal Hospital, Kilmainham, at noon on Thursday in last week, under the guidance of the hon. provincial secretary for Leinster, Mr. John L. Robinson, A.R.H.A. The party were courteously received by Viscount Wolseley, K.P., Commander of the Forces, who pointed out the objects of interest, principally armour, arranged in the great hall of the hospital. The charter of Charles II. was also shown. Lord Wolseley has caused the walls of the great hall to be decorated with trophies and armour, the greater portion of which were removed from the Pigeon-house Fort. The chapel is being restored, so that the hall is now used as a temporary chapel. The party then visited the adjoining churchyard, "Bully's Acre," and inspected the remains of the cross said to have been erected over the grave of Brian Boru's son Murrough, who was killed at the battle of Clontarf, A.D. 1014.

SHROPSHIRE ARCHÆOLOGICAL SOCIETY.—The annual meeting of this society was held at Shrewsbury on Saturday. Archdeacon Lloyd, who presided, in moving the report, urged the importance of further excavations at the buried city of Uriconium, suggested that steps be taken for the preservation of the crypt of old St. Chad's, and favoured a proposed removal from its present site of the ancient stone pulpit of the abbey to some more suitable spot. Alderman T. Southam strongly opposed the removal of the old abbey pulpit from its original position. The council and officers were re-elected.

YORK ARCHITECTURAL ASSOCIATION. — The annual general meeting was held on Thursday, Nov. 5, Mr. W. G. Penty, F.R.I.B.A., in the chair. The secretary's and treasurer's reports were read and adopted, being in every way satisfactory. Mr. Walter Bennett was again successful for the prize competition for members who have been only four years in the profession. A hearty vote of thanks was accorded to Mr. William Hepper, who is resigning the position of hon. secretary, which office he has so ably filled for some years past. Mr. Arthur Pollard was unanimously re-elected president. Mr. Alfred B. Burleigh (York) was elected hon. sec., and Mr. Norman R. Yeoman hon. treasurer. The committee for the tenth session was chosen as follows.—Messrs. E. T. Felgate, T. J. Pegg, J. G. Perry, H. Sellars, and T. Spencer Yates, A.M.I.C.E. Mr. J. Wallace Stevens (Whitwell) was elected a fellow.

Two stained-glass windows, the work of Mr. Kemp, of London, were unveiled in the chancel of the old parish church of Rugeley on the 12th inst.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

THE EMPLOYMENT OF BUILDERS AS ARCHITECTS.

To the Editor of the BUILDING NEWS.

SIR,—As a ten years' subscriber to your journal I may perhaps be permitted to make a few remarks upon your article, "The Employment of Builders as Architects."

The writer of the article uses the poor builder's clerk so roughly that as a builder's manager (say a superior builder's clerk), I feel impelled to say a few words in his behalf.

The "attribution of the incompetence and ignorance of builders' employés to architects" would be—if not a "great injustice"—certainly a gross falling away from the path of mercy, for they have already enough of their own to answer for. During the last fifteen years I have had through my hands the drawings and specifications of some scores of architects, three-fourths of which productions have displayed more or less (more particularly as regards the specifications), the "incompetence and ignorance" of their authors. I do not hesitate to say that the average builder's manager can write a more practical specification, and put the matter of it more lucidly before the reader than three-fourths of the members of the architectural profession could do. I will also assert that he can make a more practical drawing, perhaps for the reason that no inconsiderable part of his time is spent—in company with the shop foreman—in modifying the impracticable "details" prepared by architects.

Sir, a builder's manager is not necessarily devoid of education; he can think, and has even been known to possess some amount of taste, notwithstanding all ideas to the contrary on the part of that immeasurably superior personage the architect. And granting this, his opportunities of qualifying to provide for the wants of the public in the matter of houses seem to be superior to those of the *average* architect. The latter is *assumed*, at any rate, to have served articles to some practitioner, who was *assumed* by the pupil's parents or guardians to possess valuable knowledge, and to be willing, for a consideration, to impart it to the pupil. In how many instances do pupils receive—even from qualified masters — any amount of personal tuition, or are allowed to see much of work in progress? In the majority of cases they know nothing practically on completing their articles; still, if not dependent entirely on their own earnings, they shortly aspire to join the ranks of the profession. The builder's manager, on the other hand, has in most cases served a term at the bench, and had good opportunities meanwhile of seeing the work of all branches of the building trade in progress. As a manager, he has hundreds of drawings and specifications through his hands, can assimilate the good and reject the bad, and is in constant touch with building operations, every detail of which comes under his immediate attention. There is no law which prevents him from occupying his spare time in the study of design, and the details of heating, ventilation, and sanitation are not beyond the range of his faculties. He can read the illustrated building papers, and should he, in drawing an elevation, appropriate a feature, or even a whole façade, he may soothe his conscience by reflecting that such a course is not without precedent in higher spheres.

It may be the very rankest heresy; but it is, nevertheless, the opinion of many competent men that the training of the builder's manager is the architect's training *par excellence*.

I feel I have already trespassed too much; but should just like to say that I have seen some houses built on an estate where a F.R.I.B.A. had a monopoly. They illustrate in a striking manner the futility of attempting to apply large ideas to little ends. One poor investor lets a house which cost £900 for £20 per annum—not because the estate is a failure, but because *fads* have rendered the house barely habitable. It is a fact that the only decent houses on the estate are those in which strong-minded clients insisted on their own ideas being carried out. I inclose a card, and remain—Yours, &c.,

A Builder's Manager.

SUNDERLAND ASYLUM COMPETITION.

Sir,—Will you allow me to call the attention of intending competitors to the fact that no mention is made as to the intention of the committee to employ the author of the design placed first to carry out the work, or otherwise? It would be well to obtain a definite statement on this point, and so allay the rumours of an attempt at a bit of local "jobbery" which are already rife in this district.—I am, &c., On the Spot.

Nov. 17.

CAVITY-WALLS.

Sir,—Referring to previous letters respecting the above, I think the subject one of vital importance to the building trade and the health of the general public. If houses can be erected of brick on this system at much less cost, and also drier and healthier, than of stone and brick combined, it must be advantageous, in the long run, as a means of cheapening rents, or giving more accommodation for the same rent.

I have seen, in Yorkshire, many houses erected with cavity walls, and the general report is that they are not liable to damp in the least. They are built of two 4½in. walls, with a 2in. cavity and one pair of indented bricks, and cast-iron tie in every super. yard of walling, the metal being about ¾in. square, with a swelling in the middle, causing any moisture that may accumulate to drop off, and also strengthening the tie. I do not see why the use of stone should not be reduced to a minimum point where the price is high, as its use might be dispensed with except for sills and thresholds.

If any of your readers know of any better system, it would be interesting to hear from them.—I am, &c., J. W.

Intercommunication.

QUESTIONS.

[10662.]—**Roof.**—The sketch is the outline of an iron roof truss, distance apart of trusses 10ft. Will some reader kindly let me have safe scantling of the different members forming the truss. Principal rafters to be of double bar iron, kept 1½in. apart by iron distance-pieces,

the struts of T-iron, and all the tie-rods of bar iron. Two wood purlins on each slope, 9in. by 6in., to be covered with slates.—J. B. F.

[10663.]—**Timber.**—Hurst's Handbook says red pine (P. rubra), two-leaved, is a mere variety of the Pinus sylvestris, or Scotch fir (the timber of which, imported from the Baltic and White Seas, is the "red wood" of the timber merchant, the "yellow deal" of the London carpenter, and is sometimes called "Northern pine"); but the red pine under consideration (Pinus rubra) is grown in North America. Its grain is finer than the Pinus sylvestris, or Scotch fir, from the Baltic, it is not so apt to shrink or warp in seasoning, it contains less sap, and is very free from knots. All very desirable qualities. But Laslett ("Timber and Timber Trees") says red pine is the Pinus resinosa, sometimes called here "Canada red pine," grown also in the United States, and known in New England by the name of "Norway pine" (although it is entirely different from the tree so-called in Europe, which latter is a kind of spruce, which the Canada red pine is not). This red pine (P. resinosa) is further described by Laslett, in terms as to its useful qualities, identically the same as those applied by Hurst to the P. rubra. Are these two distinct trees, or do both authors mean the same tree botanically considered, and the identical same wood considered commercially? This is another instance of the miserable confusion of timber terminology.—Woodenhead.

[10664.]—**The Late Decimus Burton.**—Can any of your readers inform me who succeeded to the practice of the late Mr. Decimus Burton, or what became of his plans? He built Holwood, Kent, in 1825. The former house belonged to Mr. Pitt, and I want to find if the present is exactly on the site of the old house.—Henry Wilson.

CHIPS.

As a memorial to Lieut. W. R. P. Hamilton, V.C., who fell at Cabul in 1879, it has been decided to reproduce in bronze, for erection in Dublin, the group by Mr. C. B. Birch, A.R.A., exhibited at the Royal Academy in 1880, now lent to the museum of Science and Art, Dublin, representing the young officer, with his sword in his right hand and his revolver in his left, striding over the body of a prostrate Afghan. The Hamilton Memorial Committee estimate the cost at 2,000 guineas.

The work of rebuilding the Roman Catholic Cathedral at Edinburgh, after the recent fire, has been so far advanced, that now the two aisles are completed, and on Sunday next, these and the nave will be solemnly re-dedicated by the Archbishop. The rest of the building will be proceeded with immediately.

The Glasgow Town Council have discussed the question of taking over the whole of the tramway system within Greater Glasgow, and have resolved, by fifty votes to six, to take over all the lines on termination of the lease, two-and-a-half years hence. For the last ten years the tramway company has paid 9½ per cent.

Father Nugent has purchased from the Liverpool Corporation some disused baths and wash-houses in Paul-street for £1,500, and these premises are about to be reconstructed to serve as a Roman Catholic refuge for fallen women. Messrs. Ware and Rathbone, of Dale-street, Liverpool, are the architects, and the contract has been taken by Mr. G. C. Beecham, of Paradise-street, in the same city.

The completion of the new vicarage of St. Michael and All Angels, Bishopston, near Bristol, has just been marked by a benediction service. It occupies a fresh site, and on that formerly occupied by the old vicarage it is hoped next year to add a north aisle, transept, organ chamber, and vestries. The building has been erected by Mr. Wilkins, the architect being Mr. Beavan, also of Bristol. The cost has been upwards of £2,100.

The Bishop of Wakefield unveiled on Friday a new reredos and memorial window in St. Mary's, Barnsley. The reredos, of carved wood, painted in Indian red, with chocolate stencillings and gilded on its more prominent parts, is from the designs of Mr. G. F. Bodley, A.R.A. The window, a three-light, by Ward and Hughes, of London, has in the base the arms of the sees of York and Wakefield and the Strafford family.

The main water supply for Grangemouth, N.B., was inaugurated last week. The works have cost £4,000, and furnish 320,000 gallons or 50 gallons per head per day.

Legal.

ARCHITECTS' AUTHORITY.—III.

The plans and specifications for a building ar of course, part of the contract, and are equal binding upon the owner, the builder, and t architect himself. As soon as he goes outsi these plans, &c., he is getting beyond h limited authority, and the builder who acts up orders will, in effect, be doing so at his own ri —at all events, as far as the owner is concerne The architect's duty is to supervise the buildi and works in accordance with the statements to his authority contained in the contract, wi its plans and specifications attached; and if gives orders not covered by this written descri tion of his powers as agent, he will do so on h own responsibility and at his own perso liability, unless he gets special authority fr his client beforehand, or a clear ratificati afterwards. A building owner may leave t amplest discretion to his architect, and thus makes him a general agent as to the buil ing, and gives him a free hand practically pledge his credit with the builder. It about the burning question of extras that t difficulty often arises. Broadly speaking, architect has no general authority to order certify for extras. The contract may provi for this specially, and then the clause doing will have to be construed as a part of the wh document. The principle of the whole matter that as a limited agent his power to order ext must be plainly proved before the owner can made liable. Here, again, it is for the build to read his contract, for otherwise he may fi he has carried out works which were not pr vided for, and for which, as extras, the archit had no authority. If this happens the own will not be compelled to pay unless his impli authority or subsequent ratification can be prov which are often matters of fact involving lo and costly litigation before they are settl Again, the architect would become persona liable if he ordered work in excess of authority; but to enforce such a legal liability always an unpleasant and frequently a diffic thing to do by any contractor who looks to futu work of the same kind.

Fred. Wetherfield, Solicitor
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this colu must be headed "Building News," and m reach my offices, as above, by *Tuesday* morni to insure answer same week.

T. H. W.—Payment.—Plans prepared, quantities out, and tenders obtained on proper instructions. Ow to tenders being too high, none is accepted; that be so, the owner must, of course, pay for the quantities, notwithstanding that you may have given an estim higher than the tenders, for an estimate is only a ma of judgment, and you cannot be held liable for an er in judgment if reasonable care and skill were exercis This would also, I think, apply to the damp walls—t is, if you were guilty of no actual negligence. The c course is to sue for the fees in the ordinary way, and him counter-claim if he chooses; but it is more t probable that he will abandon his counter-claim wh properly advised.

Builder.—Lease—Covenant to Repair.—The le contains the ordinary covenant to repair, and during lease further buildings are erected on another part of land, which were not contemplated when the lease granted. The question now arises, Is the lessee bound repair these new buildings in the absence of an exp covenant to keep in repair "any buildings to be th after erected on the premises"? I think not. In an case some general proposition was made that the le would be bound to repair the new buildings; but point was not actually decided, and does not appea have been since decided, so that it may probably be ta that, without an express covenant, the lessee would be liable.

A. C.—Building Contract—Penalties for Dela Having entered into a contract to complete the build by a certain day, and subjected yourself to a wee penalty in case it is not so finished, you now find have undertaken an impossibility, and that, owing some miscalculation, the work cannot be done in anyth like the stipulated time. The contract cannot be esca from, although the time stated may now seem altoget unreasonable, and the only course is to push on as fas possible, and get off with as small an amount for penal as possible.

Jack Plane.—1. The question of publishing the l articles appearing in this paper in book form has not been considered by me; but it is very likely I shall d later on. 2. An award, like any other document un seal, must be stamped within 30 days of execution. can of course be stamped at any time on paying the d and penalty of £10; but in regard to any instrum executed after 16th May, 1838, the Stamp Act of imposes, beyond the penalty, a fine of £10 on the pe whose duty it was to see that it was properly stamp unless a reasonable excuse for the delay or the omis to stamp is forthcoming.

LEGAL INTELLIGENCE.

IMPROPER USES OF A Pparty WALL.—ISAAC v. DARE AND OTHERS.—The plaintiff, a builder and lodging-house keeper, of Dorset-street, Baker-street, sued Mr. Hoare and the St. George's Residential and General Building Company to recover damages for damage to a wall, &c. The plaintiff was the lessee from Viscount Portman, who was also the owner of the adjoining ground, from which the houses which previously stood there had been removed. This land Lord Portman had let on a building agreement to Mr. Hoare, who sublet it to the St. George's Residential and General Building Company, who proceeded to erect a large building containing flats. In the course of the building operations the plaintiff's case was that the wall in question had been so used that it became damp, and rendered the rooms in the basement uninhabitable. He also claimed for loss of light. The case was heard some time time ago, and, in the Queen's Bench Division on the 12th inst., Mr. Justice Wrance gave judgment for the plaintiff against the company for £100, with costs. He held that the defendant Hoare was not liable.

IS DUROLINE A "COMBUSTIBLE MATERIAL?"—This case under the Building Acts, Queen's Bench Division. Before Mr. Justice Mathew and Mr. Justice C. L. Smith. Nov. 13, 1891. Roof Coverings. Wayne v. Wright. The District Surveyor of East Hackney (South) and North Bow, appellant v. the Manager of the Wire Wove Roofing Co., Queen Victoria-street, E.C., respondent. Mr. Horace Avory appeared on behalf of the London County Council, and Mr. C. F. Gill for the respondent.)—This was a special case, being an appeal against the decision of the magistrate taken by the London County Council in support of the District Surveyor, who had served a notice on the respondent for covering a roof with a material known as duroline, and which was said to be combustible, contrary to section 19 of the Act of 1855. The case before the magistrate was reported in the BUILDING NEWS of May 29, 1891, p. 763, and the chief points in the evidence were as follows: The Wire-Wove Roofing Co. had covered the roof of a building used as a storehouse in rear of 81, Victoria Park-road, with a material called duroline, which the district surveyor contended was combustible material, contrary to section 19 of 18 & 19 Vict. c. 122, which provides that the roofs of buildings shall be constructed as follows: that is to say, that the flat gutter and roof of every building and every turret, dormer lantern light, skylight, or other erection placed on the flat or roof thereof, shall be externally covered with slates, tiles, metal, or other incombustible materials; and that due notice having been given by the appellant to the respondent to do certain things, he had made default in doing them. Duroline is composed of woven iron wire, coated with an oleaginous compound, which is wholly waterproof and semi-transparent, and is used at the Royal Aquarium, Olympia, Doulton's, Pickford's and other places. It was proved by experiment in court that if a light be applied to the edge of a piece of the material, the coating will ignite and will burn away, leaving the wirework uninjured; and, when in a flat position, it can be ignited by pieces of hot coal or lighted stick being placed upon it; but that the longer it is exposed to the air the more difficult it is to ignite; and that a piece that had been in use for four or five years did not ignite when pieces of live coal were placed upon it. The chemist for the London County Council had given evidence that at a temperature of 320° Fahr. the material gives off inflammable vapour, and when placed in a vessel it burst into flame five seconds before wood ignites under similar conditions. No evidence was given that any fire had taken place where this material was used, and the witnesses called by the respondent had stated that it was safer than glass when used on skylights, because lighted objects which fall through glass would not fall through the surface foundation, and because, in case of a fire, although the oleaginous coating might be consumed, the wire network would remain and would prevent the rush of flame through. The appellant had given evidence that experiments tried by him had proved that the material would ignite readily, and therefore it could not be considered as incombustible, and that it was dangerous to cover roofs of buildings with such a material. Similar evidence was given by Mr. Thos. Blashill, superintending architect to the London County Council. The respondent contended that the said material as a whole was not capable of being consumed by fire, that therefore it was incombustible within the meaning of the statute. The magistrate found as a fact that part of the material—that is to say the oleaginous coating—was conbustible; that part of it—that is to say, the wire network—was incombustible; and he held, having regard to the objects and purposes of the statute, that the material, as a whole, was an incombustible material within the meaning of the statute. The question for the Court was whether he was right in this. No fresh evidence was adduced besides the evidence brought before the magistrate. Mr. Justice Mathew said the magistrate had evidence before him that this material was safer than glass, and the Court was also informed that no extra premium was charged by the fire insurance companies when this material was used instead of glass. But, notwithstanding that, the finding of the magistrate was conclusive. He found, as a fact, that part of the material was combustible. How could it be possible on that for the Court to say that it was incombustible? The roofing was formed with combustible material, which would ignite and burn away, as was clearly shown by the specimens laid before the Court. More than that, it gave off an inflammable vapour. It was impossible to say that it was incombustible. The magistrate ought to have convicted. The case must be remitted to him with the opinion of the court. It was worth observing that this was a case where the material was new, and not where it had been up for many years, which made it much less combustible. Mr. Justice A. L. Smith concurred, though with regret, as the evidence showed that in practice the material had not caused any fire during the six years it had been in use; but the Act was clear. The roofs were to be covered with "slates, tiles, metal, or other incombustible materials." Could that include material which was partly combustible and partly incombustible? Clearly not.

ALLEGED NEGLIGENCE OF A BUILDER.—Before his Honour Judge Bedwell and a jury an action was heard at Scarborough in which Dr. C. F. Hutchinson sued Mr. W. Robson, builder, also of that town, to recover £38 17s. 3d., damages sustained to his property owing, it was alleged, to the negligence of the defendant. Defendant was erecting a row of houses adjoining Huntercombe Cottage, the property of the plaintiff, on the 26th August last, when the gale caused a gable end and a stack of chimneys to fall on the roof of Huntercombe Cottage, doing much damage to the interior of the house. It was urged for the plaintiff that the means taken to support the gable in a storm were inadequate, and that the defendant had thereby been guilty of negligence. Practical witnesses were called on both sides, those for the defendant contending that all ordinary and reasonable precautions had been adopted. The jury, after some disagreement, found for the defendant, and his Honour certified for costs.

APPOINTMENT OF ARBITRATOR. — EYRE v. LEICESTER CORPORATION.—In the Queen's Bench Division on Monday, this case came before the Lord Chief Justice and Mr. Justice Wright, sitting as a divisional court, on appeal from a decision of a Master of Chambers, confirmed by Baron Pollock.—Mr. Jones, who appeared for the plaintiff in support of the appeal, said the plaintiff, who was a contractor for the construction of main sewerage works at Leicester, had received his final certificate on the conclusion of the finishing of the contract, but there remained an unsatisfied claim for extras amounting to nearly £7,000. A clause in the contract provided for the reference of any questions in dispute to a sole arbitrator, and the plaintiff wished the matter settled in the way provided for, and as the defendants declined to concur in the appointment of an arbitrator, he went, in accordance with the provisions of the Arbitration Act of 1889 before a Master to ask for the appointment of an arbitrator; but the defendants contending that the notice served upon them was not in accordancce with the Act, the Master refused to make the appointment, and on appealing to Baron Pollock, the learned judge confirmed the Master's decision. The ground upon which both Master and Judge based their decisions was that the plaintiff had not complied with the Act, which required that notice should be given to the defendant to "appoint" an arbitrator, whereas what the plaintiff actually did was to give notice to the defendants to "concur" in the appointment of an arbitrator. The learned counsel submitted that both Master and Judge were wrong here, as it would be contrary to the intention of the Act and absurd to suppose that one side to an arbitration should have the power uncontrolled to appoint an arbitrator. If that were so, he might appoint a chimney-sweep. (Laughter.) The intention of the Legislature in providing for these arbitrations by a sole arbitrator was that each party to the dispute should be satisfied as to the character and competence of the arbitrator, and if they failed to agree, provision was made for an official appointment by a Master or Judge in Chamber. But the real fact here was that the defendants objected to arbitration altogether, and wanted to drive the plaintiff into court to try an action at law, whereas the claim must eventually go before a referee or arbitrator.—Mr. Toller, for the defendants, after arguing in support of the technical points on which the Master had ruled, contended further that this was not a case for arbitration. Out of the £7,000 claimed by the plaintiff there was only a sum of £1,277 for *bonâ fide* extras, and out of that the defendants had a claim for £480, due to the Corporation for gas, water, &c., whilst the remainder of the £7,000 was made up of claims for damages sustained by the plaintiff in consequence of leaky water-pipes, the failure of the defendants to carry off excessive rainfall, the unreasonable refusal to allow the plaintiff to construct various sections of the sewerage concurrently, and the stoppage of the works. All these things were questions of alleged negligence on the part of the defendants, and not such questions as were contemplated by a submission to arbitration. But if the plaintiff would formulate his claim, the case could go to an official referee. Their Lordships decided that the Master and Judge below were wrong on the technical point on which they ruled, and therefore the case must go back to the Master to say—First, if there should be an arbitration at all, and if there should be, then to appoint the arbitrator, their lordships expressing no opinion as to whether the questions in dispute were proper ones for arbitration or not. Costs to be left to the tribunal which should ultimately deal with the case.

NO WARRANTY AS TO DRAINAGE.—BURSTAL v. BIANCHI.—(Queen's Bench Division, Nov. 7, Before Mr. Justice Charles.)—The plaintiff, Mr. Henry John Burstal, a railway contractor of Walbrook, residing at the Retreat, Woodford, Essex, sued the defendant, the owner of the latter house, which the plaintiff occupied under a lease, for damages for its defective sanitation, alleging that there had been a warranty. The defendant denied the alleged warranty, and did not admit that there was any defect in the drainage when the house was taken. The plaintiff's case was that before he entered into an agreement to take the house for seven years at £60 rent, with the option of terminating the tenancy at the end of three years, the defendant undertook that the drainage arrangements should be in perfect order, and that upon the faith of that the plaintiff entered into the agreement. Shortly after plaintiff entered into possession he was, in consequence, as alleged, of defective drainage, taken ill with sore throat, and was laid up for two months. For defence it was submitted that the agreement which provided that the tenant should pay the expenses of internal decorative repairs, and that the landlord should maintain the fabric, could alone be regarded, and as it contained no warranty the plaintiff could not recover. After hearing the plaintiff's evidence, his lorkship gave judgment for the defendant, with costs.

SURVEYORS' FEES.—PETERS v. BREMNER.—In the City of London Court, last week, Mr. Richard Peters, architect and surveyor, 72, Wool-exchange, sought to recover the sum of two guineas from Mr. S. Bremner, 7, Moorgate-street, for a survey. The defendant said the fee was payable subject to an advance of £500 being made, which was never done. He had already once paid a survey fee—not to the plaintiff—and this was an attempt to get the money out of him over again. The plaintiff said that was not so. He was instructed by the defendant to make a survey of four houses in Baker's-road, Farringdon-street. The defendant wanted a Mr. Dodd to make an advance upon them, and Mr. Dodd would not carry out the advance unless he (plaintiff) made a satisfactory report. To do this the defendant instructed him to make the survey, and now did not want to pay. The houses were in such a bad condition that the advance was not made. The Registrar found for the plaintiff for the sum claimed, with costs.

SURVEYORS' VALUATIONS AT ROCHESTER.—The Under-Sheriff of Kent and a special jury heard, on Thursday and Friday in last week, the case of Messrs. Truman, Hanbury, Buxton, and Co. v. the South-Eastern Railway Company. The plaintiffs were lessees and occupiers of storehouses and wharfage premises in the High-street, Rochester, and required by the Company to extend their station accommodation. For the claimants Sir J. Whittaker Ellis estimated the amount of compensation to be paid for disturbance, &c., use of temporary premises, and increased cost of carrying on the business in new premises at £10,670. Mr. Henry Currey, Mr. Tewson, and other surveyors gave evidence in support of this claim. For the Railway Company there were called Mr. E. Ryde, and Messrs. E. H. Bousfield, A. R. Stenning, and other surveyors, and Mr. Tootell, brewery valuer, who estimated the amount of compensation at from £3,000 to £4,450. The jury assessed the compensation at £7,000.

The Directors of the London, Brighton, and South Coast Railway Company have decided to promote a Bill in the next Session of Parliament, the main object of which is to obtain power to acquire certain important properties for the purpose of greatly enlarging their terminus at Victoria-station.

The foundation-stone of a new Roman Catholic church at Tranent was laid last week by Archbishop Smith. The church occupies a site at the eastern end of the village, and, with the presbytery, or priests' house, which is to be attached to it, will cost £1,650. The church will be in the Early Gothic style of architecture, from designs by Mr. Biggar, Edinburgh, will consist of nave and chancel, and will be seated for about 300 persons.

WATER SUPPLY AND SANITARY MATTERS.

Eccles Local Board.—Mr. Arnold Taylor, inspector to the Local Government Board, held an inquiry at the town-hall, Eccles, on the 12th inst., into the application of the local board to borrow £6,000 for purchase of land for sewage-disposal purposes. Mr. H. Leonard Hinnell, C.E. (Proctor and Hinnell, Bolton, who have been instructed by the board to prepare a scheme of sewage disposal works), explained the nature of the ground, and its suitability for the purpose intended.

Kilmarnock Water Supply.—The town council considered, on Friday, three alternative schemes regarding the proposed purchase of the water company's works, prepared by Mr. Wilson, C.E. The first was the extension of existing works at North Craig, with improvements, at a cost of £19,800; the second, a new reservoir at Glenleitch, at £16,800; and the third, making a new reservoir at Dunton Burn, at a cost of £18,250. The committee recommended the adoption of the last-named scheme, which, after a long discussion, was carried by a majority of 15 to 7. This will accordingly be scheduled in the Bill about to be introduced into Parliament to complete the purchase of the works.

Leighton Buzzard Water Supply and Sewage.—The schemes submitted in the competition which took place last year by Mr. H. Bertram Nichols, C.E., of Birmingham, and which were adjudged the best by the late parochial committee, have finally been adopted by the newly-constituted local board, and Mr. Nichols has unanimously been appointed engineer to carry out the works. In the water supply scheme, it is proposed to pump the water from the Lower Greensand, the requisite pressure and storage being obtained from a water-tower. The sewerage scheme is partly on the "Shone" system, four ejector stations being proposed, by which means the whole of the sewers are confined to the public roads. The main outfall sewer, with various subsidiary sewers, will gravitate to the sewage purification works, which are proposed to be constructed on land to the north of the town, above flood-level of the river Ouze. This was demonstrated during the recent floods, when a visit was paid by the members of the board to the site chosen for the outfall works. The treatment proposed for the disposal of the sewage is that known as the International process, "ferozone" being the precipitant; the treated sewage from the tanks afterwards passing through specially prepared "polarite" filter-beds. The estimated cost of the works is about £15,000, and the present population of Leighton Buzzard is about 7,000.

A new workmen's club has been erected at Lowood, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

At Derby the Midland Railway Company are reconstructing the entire frontage of the station, while the railway bridge over the Derwent close by is being doubled in width. In Railway-terrace, opposite the station, a Railway Institute, providing a hall with stage and proscenium, and seated for 600 people, is being built for the same company.

The ancient 15th-century screen in Manaton Church, which is situated at Dartmoor, five miles from Moretonhampstead, is to be restored. The screen is one of the finest in Devonshire; it runs the whole width of the church, and still has a good deal of the original colouring. The restoration has been placed in the hands of Mr. Edmund Sedding, architect, Plymouth.

A new public clock, striking the hours on the large or tenor bell, and showing the time on one large external dial, has been fixed in Collingtree parish church, Northants. The clock has Lord Grimthorpe's double three-legged gravity escapement, and compensation pendulum for variations of temperature. The work has been carried out by Messrs. Wm. Potts and Sons, clock manufacturers, of Guildford-street and Cookridge-street, Leeds, from instructions given them by the architect, Mr. M. H. Holding, A.R.I.B.A., Corn Exchange, Northampton.

Dr. Jackson, the borough coroner, held an inquiry at 8, Broad Green-avenue, Croydon, on Monday, into the death of John Edward Smith, 67, a retired builder, lately residing at the above address, who died on Saturday afternoon. According to the evidence of the widow, some time since the deceased had a paralytic seizure, which made him very peculiar, and he afterwards suffered from religious mania. He had a building erected at the bottom of his garden, in which "to study religion," and he recently told the witness that he had received a message from heaven. On Saturday afternoon he complained of faintness, and then died. Dr. G. Fleming stated that cause of death was syncope from heart-disease. The jury returned a verdict accordingly.

Our Office Table.

At the closing meeting of the London School Board, held yesterday (Thursday) afternoon, the Rev. W. Copeland Bowie asked Mr. Helby, the Chairman of the Works Committee, whether it was a fact that in the case of the following six schools tendered for in 1884-5 the number of tenders was as follows:—Trafalgar-square, 19; Smeed-road, 23; Rutland-street, 21; Malmesbury-road, 23; Upper Kennington-lane, 27; High-street, Shadwell, 26; whereas in 1888-91 the number of tenders for a like number of schools was as follows:—Randall-place, 3; Trinity-street, 8; Lavender Hill, 8; Cubitt Town, 8; Ancona-road, 8; Church-street, 6. He also asked whether it was a fact that at the present time the contractors named are engaged in carrying out contracts for the Board to the amounts given, and are still being invited to tender:—Mr. H. Lovatt, £54,188; Messrs. Bull and Sons, £75,983; Messrs. Lawrence and Sons, £85,923; Mr. Charles Cox, £71,254; and, if so, whether the present system does not create an unfair monopoly, as well as bring in provincial firms to the exclusion of London contractors, and the consequent reduction of employment to Metropolitan workmen? Mr. Helby declined to answer these and other more personal questions in open meeting, suggesting that the best plan, in his opinion, would be that such matters should be dealt with in committee.

A scheme is on foot at Oxford for the creation and endowment of a New Central Museum of Art and Archæology, which is to incorporate both the present Ashmolean and University Galleries. The antiquities formerly scattered about the various University buildings have been placed together of late years, though the coins and marbles are still divorced from the rest. A cast collection for the study of ancient sculpture has been made and arranged, and Classical Archæology has been brought within the University curriculum. The Ashmolean Museum has been reorganised and refitted, and during the last six years the collection itself has more than doubled. This progress has been largely due to the impulse supplied by the gift by Mr. C. D. E. Fortnum of a large part of his collection, illustrating every period of art from the earliest Egyptian to the most perfect monuments of the Italian Renaissance. Numerous other donations have been made to the Museum, within the last two years alone over 2,000 objects having been added to the collection. Mr. Fortnum proposes, subject to a small life annuity, to hand over at once £10,000 towards the new museum, and announces that he has bequeathed the rest of his collections, together with his considerable archæological library, to the University.

Mr. Henry Tompkins writes to the daily press complaining that workmen are being employed at the British Museum in touching up the hieroglyphics on the Egyptian monuments with red paint. An example of what comes from "touching up" an antique is, he remarks, to be seen in Sir John Soane's Museum, where the alabaster sarcophagus—one of the finest in Europe, found by Belzoni—has had all its hieroglyphics, about twenty thousand, filled in with common black paint, and is now irreparably injured. This act of Vandalism was, he asserts, done by a temporary curator, now dead some years, who knew nothing of hieroglyphics. Mr. Tompkins says he saw the sarcophagus several times years ago, when there was no paint on it, and Belzoni's account agrees with this. Strangely enough, in the official catalogue of Sir J. Soane's Museum it is stated that "all the figures and lines have been filled up with blue paint, made of some preparation of copper," while the truth is the pigment is a common black paint, as any one can see.

After more than twenty years of experiments, frequent changes of engineers, and several modifications of plans, Mr. Lewis M. Haupt, C.E., reports to an American engineering journal that the harbour works at Galveston have been a total failure. Up to the present time the expenditure has exceeded £460,000 sterling, and the estimated cost for completion is four times that amount. Indeed, Mr. Haupt declares that the injuries caused by the works are actually greater than the benefits, and that the difficulties in the way of securing a deep-water channel over the outer bar have been greatly increased rather than diminished, while it is proposed to apply 6,200,000 dollars (£1,240,000) to a continuation of these experiments on a plan which must prove fatal.

A well-known and reliable public timber sale, where builders and others can be sure of buying planks, deals, battens, floorings, matchings, mahogany, oak, walnut, &c., of good quality, at reasonable prices, is a desideratum. Messrs. Goodman, Hughes, and Co., the well-known timber merchants, are going to open such at their new auction mart, 44 to 47, Bishopsgate-street Without, and the first sale will take place next Tuesday, at noon. We venture to predict that these sales will soon become the leading fixtures of their kind, and the invariable resort of builders in search of really cheap and reliable goods.

MEETINGS FOR THE ENSUING WEEK

Monday. — Surveyors' Institution. 'The Title to Land: its Registration and Transfer," by R. J. Adams. 8 p.m.
Leeds and Yorkshire Architectural Society. Address by the President, H. Thorp. 7.30 p.m.

Tuesday.—Society of Architects. "The Society's Excursion into Belgium" (illustrated), by A. T. Middleton, Secretary. St. James's Hall. 8 p.m.
Institution of Civil Engineers. Discussion on papers on "Portland Cement," by H. K. Bamber, A. E. Carey, and W. Smith. 8 p.m.
Glasgow Architectural Association Smoking Concert. 8 p.m.

Wednesday. — Society of Arts. "Measurement of Lenses," by Prof. Silvanus P. Thompson, D.Sc. 8 p.m.
St. Paul's Ecclesiological Society. "Enamels in Connection with Ecclesiastical Art" 7.30 p.m.

Friday.—Architectural Association. "John D. Sedding: his Work and Influence," by W. Wilson. 7.30 p.m.

CHIPS.

At Yeovil on Wednesday week Mr. Sam Cridland, a local builder, was examining a well at the police station, when the earth suddenly gave way, and he fell into the water beneath and was drowned.

A new Conservative Club at Huddersfield was opened on Monday. It has been erected and furnished from designs by Mr. I. Hodern.

The Half Moon Hotel at Gateshead has just been reconstructed and enlarged. The architect was Alderman Dunn, of the firm of Messrs. Thompson and Dunn. Messrs. T. and R. Lamb were the contractors.

Mr. Sydney Butler, of Park Works, Langley-lane, Vauxhall, S.W., has recently opened a timber shop there, where all kinds of wood-working machinery, circular and band sawing, planing, moulding, &c., may be seen in operation.

Memorial stones of a Wesleyan chapel were laid at Colan, near St. Columb, Cornwall, last week. Mr. John Ennor, jun., of Newquay, is the architect, and Messrs. Tippett, of St. Columb, are the contractors.

The Bishop of London will be presented on (Friday) afternoon with a pastoral staff, designed by Sir A. W. Blomfield, A.R.A., and executed by Messrs. Carrington, of Regent-street, W.

Buxton-road Wesleyan Chapel, Huddersfield, was reopened on Wednesday week, after renovation and reseating. The works have cost £2,000, and have been carried out by local contractors from plans by Mr. E. W. Lockwood.

Memorial stones of a new Wesleyan Chapel were laid at Martinstown, Dorset, last week. Mr. John Wills, of Derby, is the architect, and Messrs. Davis and Son, of Dorchester, are the builders.

The decorations of the baptistery of the Church of the Holy Nativity, Knowle, Bristol, have just been completed by the filling-in of the six windows with stained glass, and the gilding and decorative painting of the semi-dome which forms the vault. The work has been designed and carried out by Messrs. Joseph Bell and Sons, of College Green, Bristol.

Mr. Ernest Beckett, M.P., laid, on Tuesday, the foundation-stone of the new schools to be provided for the parish of St. Chad's, Far Headingley, at a cost of £2,000. The buildings will include a room 48ft. by 32ft., and are to be of brick, with stone dressings and red-tiled roofs. The architects are Messrs. Perkin and Bulmer, and the contractor Mr. Thomas Bateson.

A volunteer drill-shed at Uppermill, Saddleworth, near Huddersfield, was opened last week. It has cost £1,000, and was built by Mr. Isaac Dixon, of Liverpool.

Trade News.

WAGES MOVEMENTS.

ERDEEN.—The strike of Aberdeen plumbers has lasted three weeks. The masters on Saturday ed ½d. per hour of advance from 1st March. men demand an immediate increase of 1d. per .

CHIPS.

Rousseau, the distinguished Director-General e Belgian Department of Sciences, Literature, Fine Arts, died at Brussels on Sunday. He had s younger years been one of the best writers on Paris *Figaro*.

ssrs. Jones and Willis have just completed fixed a wrought-iron screen across the chancel ll Saints' Church, South Acton, under the rintendence of Mr. Edward Monson, jun., tect. They have also in hand a screen of ar character which, when completed, will be at St. Clement's Church, Fulham Palace-

ward Clarkson Tattersall, described, we trust ror, as an architect, was remanded at the efield Police-court on Monday on a charge of ig threatened his father, a plasterer, who for al years was a member of the Wakefield Council. It was stated that the prisoner een for some time addicted to drink.

e foundation-stone of a new town-hall for , Lancs, was laid on Friday. The building e Gothic in style, and the chief room will be by 28ft. The design was prepared by Mr. nson, surveyor to the Colne local board, and stimated outlay is £8,000.

e new police buildings in Oriel-road, Bootle, opened on Monday. They have been con- ted from plans by Mr. C. H. Anderson, the actors being Messrs. George Wood and Son, ootle, and the clerk of works Mr. Worrall. tyle is Classic, and the outlay has been over 00.

Holloway's Pills never prove delusive, or give merely temporary relief, but attack all ailments of the stomach, lungs, heart, head, and bowels in the only safe and legitimate way, by cleansing the blood, and so eradicating those impurities which are the source and constituent of almost every disease.

PUBLIC TIMBER SALE.

Planks, Deals, Battens, Floorings, Matchings, Mahogany, Walnut, Oak, &c., by

GOODMAN, HUGHES, & CO.,

at their NEW AUCTION MART, 44 to 47, Bishopsgate-street Without,

NOVEMBER 24th, 1891, at 12 o'clock. If you'll only come, you'll buy. GOODMAN, HUGHES, and CO., Importers and Merchants' Brokers.

PUBLIC SALE.

HAM HILL STONE.

The attention of Architects is specially invited to the Durability and beautiful Colour of this material.

Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.

Address:—

THE HAM HILL STONE COMPANY,

NORTON, STOKE-UNDER-HAM, SOMERSET.

London Agent:—

Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

DOULTING FREESTONE.

THE CHELYNCH STONE.—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

CRAIGLEITH STONE.

UNEQUALLED for Staircases, Steps, and Landings, especially for Public Buildings with great wear. VERY HARD, and NEVER WEARS SLIPPERY.

SOLE AGENTS for England,

J. & A. CREW, Cumberland Market, London, N.W.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

WM. OLIVER & SONS,

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,

120, BUNHILL ROW, LONDON, E.C.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

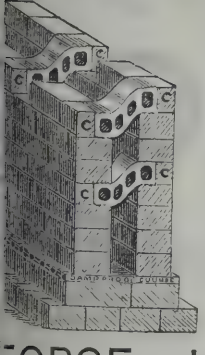
*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

ALDERBURY, NEAR SALISBURY.—For lodge, coach-house, stabling, &c., for Mr. W. M. Osmond, of Calcutta and Salisbury. Mr. F. Bath, F.R.I.B.A., F.S.I., architect. Quantities supplied:—
Mitchell, C., Woodfalls, Salisbury (accepted for all save stable).

BAUMBER.—For the restoration and reseating of the parish church:—
Walter and Hensman, of Horncastle (accepted).

BRISTOL.—For reconstructing the Perry-road curve and other alterations to the Drawbridge line of tramways:—
Krauss, A., Bristol (accepted).

BROMPTON.—For shop fittings, &c., at the Albion Bakery, No. 213, Brompton-road, S.W., for Mr. E. P. Joyce. Mr. W. A. Burr, M.S.A., 65, Chancery-lane, M.S.A., architect:—



Larke and Son	£244 0 0
Stevens Bros.	227 0 0
Hocking (accepted)	195 0 0

CHRISTLETON.—For the erection of a Primitive Methodist Sunday-school for 150 children:—
Youd, J., Rowton (accepted).

DEVONPORT.—For building a board school in Stuart-road:—
Lethbridge and Sons, Plymouth (accepted) £7,000

JENNINGS'

IPROVED PATENT BONDING BRICKS FOR HOLLOW WALLS.

A House to be Healthy must be Dry—Warm in Winter—Cool in Summer—and not Influenced by External Change of Temperature.

THE SPECIAL ADVANTAGES OFFERED BY THE USE OF THESE BONDING BRICKS ARE—

1st. Absolute dryness of the inside portion of the Wall and House.
2nd. Increase of Temperature, consequent on the non-conducting properties of the air-space.
3rd. Stronger and Firmer Walls than can be constructed in any other manner with the same quantity of material, the Bricks which would build a 9in. wall being sufficient, with the addition of the Bonding Bricks, to build a 12in. wall, and the bond or tie being perfect.
4th. Their indestructibility—they being by far the most durable portion of any building where they may be introduced.

JENNINGS' PATENT AIR-BRICKS, in Stoneware or Terra-Cotta, are cheaper than Iron in first cost—do not Rust and Stain the Walls—do not require Painting—will last for ages.

JENNINGS' Improved Patent Drain-Pipes, Ventilating and Grease Traps, Syphons, Yard Sinks, Ridge Tiles, Wall-Copings, Chimney Pots, &c., and every description of Stoneware and Terra-Cotta Goods.

FOR PARTICULARS, APPLY TO

EORGE JENNINGS, SANITARY ENGINEER, STANGATE, S.E.

Or THE SOUTH-WESTERN POTTERY, PARKSTONE, DORSET.

AWARDED THE GOLD MEDAL, PARIS EXPOSITION, 1889.

TWELVE GOLD AND SILVER MEDALS AWARDED.

ZINC ROOFING.

F. BRABY & CO., LD.

GLASGOW: 47 & 49, ST. ENOCH SQUARE.

DOVER.—For new premises, Market-square and Market-street, Dover, for Mr. H. Hart. Mr. E. W. Fry, architect. Quantities by the architect:—

Webster, Folkestone	£5,850	0	0
Wise, J. J., Deal	5,770	0	0
Denne, W. and J., Walmer	5,650	0	0
Denne, G. and Son, Deal	5,450	0	0
Lewis and Son	5,425	0	0
Hayward & Paramour, Folkestone	5,398	0	0
Stiff	5,183	0	0
Bromley	5,040	0	0
Dowle, W. T.	4,946	0	0
Richardson	4,800	0	0
Lewis, W. G.	4,740	0	0
Austen and Lewis*	4,719	0	0

* Accepted with modifications.
Rest of Dover.

DUXFORD.—For new farmstead at Duxford Grange, Cambs. Mr. J. B. Corby, F.S.I., Stamford, architect:—

Glasscock and Son, Bishop's Stortford	£1,984	0	0
Turner, Wainfleet	1,885	0	0
Bell and Son, Saffron Walden	1,795	0	0
Thoday and Son, Cambridge (accepted)	1,575	0	0

GREENWICH.—For the erection of a school in Mulgrave-place, Greenwich, to provide accommodation for 805 children, for the London School Board:—

Chappell, J. T.	£19,931	0	0
Mowlem, J., and Co.	19,574	0	0
Lathey Bros.	19,524	0	0
Boyce, T.	18,400	0	0
Holliday and Greenwood	18,257	0	0
Hart Bros.	17,863	0	0
Downs, W.	17,416	0	0
Foster and Dicksee	17,278	0	0
Hobbs, J. W., and Co. (Limited)*	17,210	0	0
Holloway Bros†	16,975	0	0

* Accepted.
† Withdrawn, owing to an error of £653 15s.

[(*a*) Cost of school buildings and closets, £12,610; (*b*) tar pavement and covered playgrounds, £770; (*c*) boundary walls and gates, £980; (*d*) three teachers' rooms, £300; (*e*) schoolkeeper's house, £1,280; (*f*) glazed bricks, £785. (*g*) Extra depth of foundations, £485; for whole of brickwork to be built in cement add, £290; total, £17,5'0. Cost per head of (*a*), £15 13s. 3d; total cost per head, £21 14s. 9d.]

HAM, SURREY.—For the erection of an infant school in East-street. Mr. Harding, of Ham, architect:—
Potter, J. B., Sutton (accepted) ... £1,187 0 0

HELSCOTT.—For alterations to Helscott Bridge, for the Cornwall County Council:—
Hobbs, J. D. (accepted) ... £136 0 0

HERNE BAY.—New slaughter-house, stabling, and premises, Richmond-street, Herne Bay, for Mr. F. W. Boulding. Mr. H. Farley, Richmond-street, Herne Bay, architect. No quantities:—

Admans, G.	£375	10	0
Taylor, E.	369	12	0
Ingleton, A. S.	348	0	0
Welby, C.	310	0	0
Adams, E. T. J. (accepted)	260	0	0

All of Herne Bay.

LONDON.—For additions to the Hive, Anson-road, Tufnell Park, for Mr. E. F. Bradley. Messrs. Truefitt and Truefitt, 5, Bloomsbury-square, W.C., architects:—

Bird, S. G.	£352	10	0
Hunt, J.	297	0	0
Lown, R. D., and Sons (accepted)	247	10	0

LONDON.—For new drainage system at 405 and 407, Holloway-road, for the London and South-Western Bank, Limited. Messrs. Truefitt and Truefitt, 5, Bloomsbury-square, W.C., architect:—

Stuart, G.	£159	0	0
Lown, R. D., and Sons	152	0	0
Hunt, J. (accepted)	132	0	0

LONDON.—For additions to No. 434, Holloway-road, for Mr. F. Matthews. Messrs. Truefitt and Truefitt, 5, Bloomsbury-square, architects:—
Hunt, J. £230 0 0
(No competition.)

LONDON.—For additions and alterations to the public baths, Marshall street, W. Messrs. Spalding and Cross, architects:—

Mowlem, J., and Co.	£7,315	0	0
Downs, W.	7,253	0	0
Stephens, Bastow, and Co.	7,199	0	0
Kellett, A.	7,035	0	0
Minter, F. G.	6,950	0	0
Outhwaite, J., and Son	6,875	0	0
Brooks, W.	6,800	0	0
Neave and Neave	6,712	0	0
Robson, J. F.	6,673	0	0
Batley, R. G.	6,624	0	0
Smith, J., and Sons	6,586	0	0
Nightingale, B. E.	6,547	0	0
Balaam Bros.	6,468	0	0
Jones, Richards, and Co.	6,397	0	0
Brass, W., and Son	6,393	0	0
Rowe, Bros.	6,350	0	0
Holloway, H. L.	6,333	0	0
Castle, W. and H.	6,291	0	0
Gould and Brand	6,280	0	0

MALVERN.—For manager's residence for Messrs. Schweppe and Co., Limited, in connection with their C wall Factory. Quantities by Messrs. Morris Evans a Sons, 7, John-street, Adelphi. Messrs. Truefitt a Truefitt, 5, Bloomsbury-square, W.C., architects:—
Wood, J., and Sons, Worcester ... £1,200 0 0
(No competition.)

NEWPORT, MON.—For extension to the Newport Mo Lodging House Co.'s premises, Dock-street, Newpo Mon. Mr. E. A. Lansdown, 26, High-street, Newpo Mon., architect. Quantities by the architect:—

Richards, E.	£2,700	0	0
Linton, J.	2,495	0	0
Blackburne, W.	2,289	0	0
Morgan and Roberts	2,150	0	0
Price, W.	2,074	0	0

NORTHUMBERLAND.—For the extension of the n infirmaries at the Northumberland County Luna Asylum, for the County Council:—
Building works:—
Howe, J., West Hartlepool (accepted) ... £4,312 9
Engineering works:—
Somerset, J. A., Newcastle (accepted) ... 290 0

PONTYPOOL.—For the erection of the Hanbury Assem Rooms, arcade, shops, &c., at Pontypool. Mr. E. Lansdowne, 26, High-street, Newport, Mon., archit Quantities by the architect:—

Welsh, Hereford	£6,490	0	0
Price, W., Newport	5,788	0	0
Parfitt, H., Pontnewydd	5,389	0	0
Stephens and Bastow, Bristol	5,299	0	0
Morgan and Evans, Pontypool	4,997	0	0
Linton, J., Newport (accepted)	4,895	0	0

RUDGWICK, SUSSEX.—For the erection of private ho Mr. W. H. Harrison, A.R.I.B.A., architect. Quanti by Mr. F. C. Hunt:—

Andrews and Nanson	£2,377	0	0
Hunter and Bryant	2,007	0	0
Chinchen, F. T. (accepted)	2,000	0	0

SUNNINGDALE.—For servants' hall at Broadlands, for C. D. Kemp Welch. Messrs. Truefitt and Truefitt Bloomsbury-square, architects:—
Norris and Son £234 0 0
(No competition.)

SUNNINGDALE.—For new dairy at Broadlands, for C. D. Kemp Welch. Messrs. Truefitt and Truefitt Bloomsbury-square, W.C., architects:—
Norris and Son £119 0 0
(No competition.)

PROFESSIONAL AUTHORITY.

LIENTS and committees have often a strong inclination to expect more from ir architect than the powers they have ted in him entitle them to ask for. example, a limit of cost strenuously sted upon restrains very much the means pportunities of carrying out an effective lding; the client is disappointed with the ılt, and thinks he might have had some- ıg better; or perhaps a plan of the ıloyer is closely followed, which in the does not satisfy him, and he blames his iser for letting him have his own way. both cases the architect has been too scientious and easy, and for his pains ı an unmeasured share of criticism or se. If he had exceeded the cost in first instance, or declined to agree his employer's ideas in the second, he ht have been praised, at least, for his l and independence, even if he had for- ed his reputation as an inexpensive itect. But he can better afford to be ught extravagant than unskilful. The nsistency is in those who employ pro- ional men, and then ignore their advice recommendations. There are other 's in which a building owner may impose rictions; but these two, as to cost and e, are the most common. The blame in er case is cast upon the architect. The ider at once considers it is the duty of professional man to adopt the best plan, advise his client, and, after all, this ion is right, and founded upon a proper v of the duties of a professional man. en a wealthy speculator had not long e to pay a round sum to his archi- for erecting a residence equal to expectations of a millionaire's residence, ı although the estimate alleged to be ally given had been exceeded, the public erally agreed to the verdict. The owner ted a sumptuous mansion at a small ; he gave his architect a *carte blanche*, afterwards grumbled at the expenditure. other words, his expectations far ex- ed the sum he wished to expend. The ience of some people is amazing. They t to obtain more than they can, or ought, easonably expect, and the luckless archi- if he does anything to assist their itious ideas, by exceeding the estimate, verely taken to task; or if he restrains r extravagance by keeping within the ıds, he gets blamed for producing a bare imperfect building. But a question arises, pressing in its direct bearing he profession, which is, What should be ttitude of the architect in relation to cer- matters of design or building which may en to come up? Whether he is justified ıcting on his own responsibility in ring what he thinks ought to be done he efficiency of the building; or whether hould follow the contract specification so ly as rather to deprive the building of hing that would add materially to the n or the advantage of his client? The tion we have hinted at is one which very ly concerns the profession in these days en competition, and the encroachments e by those who do not strictly belong to anks. In a word, the principle at stake ıe authority vested in the architect to ove or alter his design as he thinks ssary. Looking at the question from rt point of view, or as the practice of artists suggests, the architect ought, it d seem, to have certain discretionary power given to him. The painter, the sculptor, or decorative artist each is free to change or modify his composition or his scheme of decoration as he proceeds, and why should the architect be fettered? But it will be said that painters, sculptors, and decorators are not tied and restricted by contract; the architect has his own way at first till the contract plans and specifications are prepared, after which he is bound to observe them. Again, from a legal point of view, many objections could be taken against any alteration or modification being made after the contract has been signed by the parties. The contract once settled between building owner and contractor, the architect is under an obligation to his client to see that the work is carried out strictly as agreed to. From the point of view of contract and its legal obligations, the architect is denied the freedom which other artists enjoy. Buildings are costly, and alterations involve sometimes considerable expense.

But there are circumstances under which the architect is called upon to act. He sees some modification or deviation absolutely essential to the work; he sees the importance of ordering deeper or more costly foundations, of adding to the thickness of a wall, or of doing something which the progress of the work actually demands. The question occurs to him whether he should consult his client or make the necessary improvement on his own responsibility. Legally, the position of an architect under these circumstances is that of a "general agent"; he has assumed authority independent of any special agreement to do that which he thinks the best, and to this extent can bind his employer by his orders; but, unfortunately, the law is not very explicit as to how far it would be safe for an architect to make alterations or to bind his employer. According to one decision ("Cooper v. Langdon"), this "agency" idea is not very strong, as judges take different views of the powers vested in an architect as agent. Both the decision given in the above case and that of "Rex v. Peto" appear to indicate that an architect must show an authority to bind his client by any deviation. In the first-named case the architect gave directions to the builder to substitute a stone wall for one of brick without the consent of the employer, and the latter brought an action against builder for breach of contract. In the second case the deviation was the omission of piling in the foundations, and it was held by the Court that the architect's power to order "additions or omissions" gave him no authority to order a variation. If these rulings are taken for what they are worth, it would appear to be very hazardous for any architect to order a variation without consulting or obtaining the permission of his employer. On the other hand, a "general agent" is supposed to possess some discretion irrespective of any express agreement, or, as one authority has stated, "a general agent can bind his principal by all acts within the scope of his employment as against third parties, although the employer may have privately limited his authority." Thus an architect who has instructions to prepare plans and obtain tenders has an implied authority to engage a quantity-surveyor, or to prepare bills of quantities. But this authority is derived from custom, which must be proved, as there is no legal decision which appears to give an architect the right to exercise any particular authority. From these and other considerations it is extremely doubtful whether an architect can exercise any authority independent of any commission conferring upon him special powers.

From decisions of the Courts it is hard to say what is intended by the expression "within the implied authority of the architect." On these grounds the profession ought to obtain from their employers a discretionary power in acting within the scope of their employment. During the execution of a building it may happen that the architect may have brought to his notice some important point which may not have occurred to him when preparing the design. Unforeseen circumstances take place. It may be the necessity of sheet-piling the foundation, of putting in deeper footings or concrete, or some point of construction that could not be neglected without jeopardising the building or reducing its stability. The variation would entail an addition to the cost, which the owner or employers might not sanction. What is to be done? Is the architect to carry out his plans knowing at the time they would lead to a failure; or is he to take advantage of his authority as general agent? We cannot accept the dictum that the owner's wish is the only rule for the architect to follow. For the wish of the owner, if obeyed, may cost him a much larger amount if any accident took place. The architect's wiser discretion may in fact be the means of saving his client from serious loss or damage. In the majority of cases, employers would at once sanction any variation they thought essential, if brought to their notice; but there are individuals with whom a narrow and rigid observance of contract is thought preferable to increase of expenditure, and it is with regard to these we speak. In important undertakings, a certain percentage for contingencies or extras should be allowed to the architect that would enable him to authorise any variation he thought absolutely essential in the execution of his design. We have known contracts during the performance of which the employers are absent and cannot give the requisite order for alteration or extras; in public contracts, the proviso that an order for an extra must be signed by the chairman of committee cannot always be complied with, and a serious delay would arise if the architect or engineer had no discretion or power to act under any emergency.

Limit of cost is not equivalent to economy, but often detrimental to efficient workmanship. A sum spent on extras or variations wisely, may materially add to the efficiency of a building, and save the building owner considerable disappointment and subsequent alteration, as every builder knows that an alteration made after the work is completed costs 50 per cent. more, often double the sum that would have been sufficient while the building was in progress. Many penny-wise-and-pound-foolish employers appear to think that every "extra" incurred is an imposition, and goes into the contractor's pocket, instead of so much more value added to their work. We do not deny that "extras" are undesirable if they can be avoided; but all we say is, that they are often necessary evils, and may be of benefit to the employer.

One other kind of variation or addition to cost which seems to be within the scope of the architect's employment, is that relating to artistic design. It has been said that when limit of cost is incompatible with the carrying out of the design in its integrity, it should rule. In this case, also, the designer should be permitted some liberty: he ought to have power to alter, if need be, his design in matters of detail. But the question is, how far ought he to be allowed to make modifications, without consultation with his employers? The majority of owners would not trouble about any exercise of taste if it did not entail extra cost. We think on both structural and artistic questions the architect should reserve to himself certain discretionary powers, within reasonable limits. What these are we will not attempt to define: the extent and circumstances of each contract are the only criteria; but, whatever they are, they ought to be made a matter of express agreement. One presumptive reason for con-

ferring certain powers on the architect is that if he does not exercise them, and the building turns out to be a failure, he is regarded as the responsible individual. To say that the tender was a low one, and was insufficient, or that it was accepted against the architect's opinion, will not avail him much after the mischief is done. Everybody then is inclined to cast the blame upon him, no matter what his recommendations were; he is, in fact, liable morally, if not legally, for any shortcomings in the design or the contract.

ASYLUM PLANNING.—II.

OUR former remarks on this subject dealt with the principle of arrangement of the blocks, of which we distinguished the "linear or continuous" principle of building suitable for small asylums—the echélon plan or "broad-arrow" principle of corridor connection, the quadrangular or H-shaped plan, and one or two other varieties; we also discussed the question of the best form of block or ward, and we gave the opinion of one authority, and described the mode of classification adopted in some of the principal institutions for insane patients. We will in this article confine ourselves to a few details of planning. In America another general plan has been followed in which the blocks are completely detached and distributed at greater or less distance from the centre administration. These blocks assume the appearance of detached villas, which allow of very desirable separation or classification, and the results are said to be very satisfactory, though we have not sufficient information about them to warrant us in forming any conclusions. Whatever principle be adopted, the main objects ought to be to separate the pavilions as much as practicable, without necessitating long corridor connection; and to make them as cheerful as possible, the blocks should be planned so as not to be in each other's prospect, a consideration which the *échelon* plan insures. The idea of confinement should be avoided by every means; sunshine in the principal day-rooms and dormitories ought to be secured as one of the principal curative agencies in mental depression; the corridors connecting the blocks should be of one story, the wards should be arranged to reduce the service of administering as much as possible. The classification of patients leads of course to a proper distribution of the blocks of wards, and to a due proportion of day-rooms, dormitories, and single rooms. We have spoken of the general classes of patients whose accommodation has to be provided for, these being: (1) the sick and infirm, and recently-admitted patients; (2) acute or refractory patients; (3) the epileptics; (4) the chronic, and (5) working patients. Each of these classes is better in one position than another, and those who know the working of asylums are unanimous in placing the recently-admitted and the infirm under the immediate control of the medical officers. The wards for acute or epileptics require also constant control and supervision, and may be situated northwards of those for the infirm, while those of the chronic or working patients may be placed in a retired position in the rear or facing the airing yards, and may consist of day-rooms and dormitories, with but a small proportion of single rooms.

We now consider in more detail the planning of wards for the different classes. The habits and mental peculiarities of insane patients have to be studied before a perfect arrangement can be arrived at. Generally, every ward floor should be self-contained; the day-room and the dormitories for bed-ridden patients should have a southern or south-eastern aspect, as brightness and cheerfulness are particularly necessary. The classification of patients will, of course, dictate certain differences of plan. Thus, the sick and infirm block is better placed near the administrative centre, and under more easy control of the medical staff. The plan ought to allow of a separation of some of the patients by having two or more day-rooms, with a dormitory or two on the same floor. Mr. G. T. Hine, who is an authority on this subject, says: "The infirmary wards, which, including the reception ward, should generally provide accommodation for one-fourth the total number of patients, are best placed nearest the administrative centre and to the medical officers' rooms, and should not exceed two stories in height; or if three, the top floor should be devoted to dormitories for quiet patients. Each ward should be self-contained on a floor, and comprise one or more roomy dormitories, one with a southern aspect for bedridden patients, and with windows on at least two sides to allow of cross ventilation, as, indeed, should be the case in all dormitories. The superficial area and cubical contents of these rooms should very much exceed those occupied by healthier patients (the Lunacy Commissioners say one-third more); at least two comfortable day-rooms should be provided for convalescents, one especially for dining in, as these patients rarely go to the general hall for this purpose." Single rooms need not be so numerous in these wards, and one room to every six or seven patients is thought sufficient. A room, or rooms, for attendants must be provided in proportion to number of patients. The attendant's room may form one of the range of single rooms, and be convenient to the dormitory as well as dayroom at the angle. An annexe with closets, &c., a bath-room, lavatory, ward scullery, store-room, boot-room, are, of course, important. These may form a wing in rear of day-room, with corridor on one side, in the following order, a lavatory at the day-room end, next to it a bath-room for, say, two baths, then a store-room, then coals. The ward scullery may be at the end of a dayroom or at its junction with a rear wing. The scullery ought to be fitted up with a small range, a sink, and cupboards. The closet annexe ought to have an isolating passage with cross ventilation, and have about one closet to ten patients, and urinals on the male side, and a separate closet for attendants. A small room for slop sink and brushes, and places for linen and coals are required. The dormitories should be provided also with a closet and slop sink or two isolated by a neck, and with a coal closet at one end or in the rear. These offices and closets should be lined with an impermeable washable material like glazed bricks or tiles, the floors should be of tiles or concrete, and the closets have simple apparatus that will not get easily out of order. The ordinary "hopper" closet with trap in one piece of earthenware is recommended.

The wards for epileptics differ in some points. The ground floor is desirable for epileptics. Mr. Hine says that the day-rooms are better rectangular, without breaks or obstructions, which might conceal an epileptic in a fit. The wards may be less subdivided, the dormitories large and capable of accommodating five-sixths of the patients, the remaining one-sixth being given in single rooms opening out of the dormitory instead of dayrooms, though the latter should have one or two single rooms for difficult patients. In small asylums the epileptic cases may be arranged for on the ground floor and the acute cases above; but in large buildings the two classes are best separated in distinct blocks, as inmates suffering from acute attacks are not desirable neighbours to the quieter patients. The floors for acute cases must be soundproof; the day-rooms may be profitably subdivided by partitions with glass panels, so as to admit of better control by the attendant. For acute and refractory cases it is safe to allow one single room to every three patients. Unlike the single rooms epileptics, those for the acute cases sho open out of the day-rooms, and dormito on the same level are desirable for a few the most refractory. The question of proportion of single rooms in any clas ward is determinable by the actual requ ments. With ample dormitory accommo tion, single rooms for one-fifth of the t number is thought sufficient, but the portion will vary according to the clas patient. Thus while one room to e three patients is necessary for the acut refractory inmates, epileptics may have room for every five or six, the infirm one r to six or seven, and the quiet and working to every ten patients. Single rooms sh have windows protected by shutters, there should be no open fireplace, each r being warmed by hot air with inlet extraction flues. Infirmary wards may open fireplaces. The doors of epileptic should have a narrow opening to allo attendant hearing any patient who may a fit, but Mr. Hine suggests that inspe holes in doors are to be avoided, as suggest espionage. A better plan is thinks, to use a silent lock, which ca opened as easily as a shutter, without turbing the patient. In some wards u panels of plate glass are necessary.

Wards for the chronic cases, or the and working patients, may be retired, a have hinted, and placed at the north en corridors, or facing the airing yards. I day-rooms are the most important pa the ward plan, with ample dormitor say large enough for 30 beds—attach or on the upper floors. A room of wide is the maximum. An upper- ward should have about two exi staircases of incombustible material, so in case of fire they may not be cut off these may be made semi-detached towers. The commissioners also requ fireproof ceiling to all rooms occupie patients, if such ceiling is next the roof there can be no doubt that much safet comfort would be insured by fire and so proof floors generally in buildings of character. Skirtings of cement bevell top, with plastering of Parian cemen walls, are desirable. All windows s have upper hinged fanlights, the lowe being divided by mullions, with ce pivoted sashes.

The administrative block we have al considered in general terms. There few of the apartments that require s attention, such as the recreation hall kitchen, stores, laundry buildings, and shops, those latter being kept distinct male and female sides. The genera should be capable of seating about ha number of patients — there should stage at one end, with dressing-roo approaches from both sides. In a establishment the hall and chapel occupy one block, the hall being o ground floor and the chapel above. kitchen, sculleries, larders, and offices be ample for the requirements and ne dining or recreation hall, and in asylums separate dining-rooms are pr for some of the patients, while the and attendants have their mess-room the kitchen. The chapel, the rec hall, the kitchen, and also the sc are generally arranged on the centra dividing the male from the female The front corridors, running east and may have first in the centre a visiting or rooms, then the recreation or dinin and between this and the kitchen a serving-room and scullery side by each opening at one end into the ha the further end into the kitchen. rear of kitchen may be the scullery kitchen courts and stores on each Northwards of this may come the d court, with approach road and

ward's store; then the washhouse buildns, with drying stores and an open court front and back, and all these central ldings may be comprised between two in corridors running north and south, so t they may be readily accessible to erent portions of the asylum. The ndry buildings should be on the women's , but having access to men's wards. The tem of drying introduced by Mr. Hine at ttingham, by blowing warm air by a fan ough the horses, is expeditious and nomical, and has been used by him with ch success. The superintendent's house y, with advantage, be situated independly of the central block, though near it, ied by a corridor. Other ordinary buildis demand attention; these are the dissary, an isolation hospital for infectious s, arranged some distance from the n buildings, mortuaries for both sexes, , for each of which many recent plans y be consulted. The system of warming ventilation that appears to be most favour is that in which warmed air is itted or propelled by fan into trunks, ice into flues in the walls, with inlets the rooms under control. Extraction s in connection with up-cast shafts ought e provided to carry away the vitiated air n all the rooms, and this system is more iently promoted by mechanical agency n by relying entirely on natural means. this system fresh air, warm or cold, is itted at the top of each room, and the foul extracted at or near the floor level. The air est warmed by hot-water pipes or steam eries. It is a great advantage to be able egulate the temperature of each room, to do without open fireplaces, as, accordto those who have the supervision of ents, there is some quarrelling for places nd a fire. Yet the open fireplace ought e provided in some of the day-rooms and nitories, and, hygienically, cool, fresh air breathing is better than warm air.

ARCHITECTURE AN ART OR PROFESSION?

(From the *Times*, Nov. 24.)

is amazing what zest busy practical men find in the discussion of a purely academical tion. That must be the first reflection of y reader of a correspondence which has been g on in our columns. Here are eminent itects, to whom time is money, arguing with ation, and even acrimony, whether architre is an art or a profession. The Platonic gues are full of such wit-sharpening disons; and one can imagine the arguments by our correspondents thrown into a contion, with apt dramatic setting, in which, in nd, an unwary disputant, committed to some considered proposition, would be cornered. our correspondents are not philsophers, us about deep problems, but busy men; dwell not near the groves of Academe, but, aps, in St. John's-wood, the City, or West-

The Royal Institute of British Architects been taking steps to introduce a system of inations and diplomas. Certain architects others, and among them Mr. Norman Shaw, essed to the Institute a memorial protesting nst the innovation, which would set up cious distinctions, subject to the test of ination qualities which must elude all such e tests, and transform architecture from t, open to all with native aptitude for it, a close profession. Thereupon several ur correspondents, such as Mr. Woodand Mr. White, replied, "You mis- the object of the Institute. With architect as artist it has nothing to do. nnot pretend to say whether the young itect has genius; it can tell whether he can or cipher and possesses an elementary wledge of the conditions of healthy drainage. are providing only for the architect as a man siness." And so the discussion proceeds; Norman Shaw and his friends looking at one of the shield and saying architecture is an s much as sculpture or painting, the Pret of the Institute and Mr. Woodward intent upon the other side of the shield, and saying that it is as much a profession as engineering.

Suppose that we look at both sides of the shield. The history of architecture is full of examples of men who entered it, not by the chief gates, but by all sorts of side doors. The great Italian architects were painters, sculptors, workers in metal of various kinds, with no diplomas or connection with the "Institute" of their day. They passed from one art to another with amazing versatility and rapidity. By a species of divination they mastered technicalities which took men of ordinary wit years of apprenticeship. Michael Angelo, Leonardo da Vinci, and Brunelleschi "served their articles" to no one; they struck out a magnificent conception, and straightway stone, wood, and iron became their willing servants. Many modern architects have been, if not exactly heavenly born, trained in ways at first sight indifferently suited to fit them for their career. Wren's education was best calculated, with ordinary materials, to make of him a philosopher. He was no ordinary character; and so he became the constructor of St. Paul's and a multitude of churches in which he found scope for his scientific knowledge. Inigo Jones was trained very much as were the artists of his day; he did not cease to be an artist when he became an architect. There is also the other side of the shield. We build houses to live in them as well as look at them. They must be watertight, constructed with due reference to the qualities of the materials, the conditions of health, and the purse of the occupants. The humble details about buildings, which some architects loftily leave to the clerk of the works, are all-important to the man who is to dwell in the house. He will not be satisfied if porous stone, or unseasoned wood, or half-baked, crumbling bricks are used, to be told that his architect, an artist, has made the building a picturesque part of the landscape. When the latter asks his 5 per cent. or other charge on bad workmanship, his client looks to the side of the shield which Mr. Woodward and Mr. White have been studying, and which Mr. Seth-Smith describes in the letter which we publish to-day; by the paymaster, in such circumstances, the architect is viewed much as a tradesman who had sent home a defective carriage or watch. It would be unreasonable and unfortunate if the "specialist" referred to in Mr. Woodward's letter in another column had to be often called in, to do many of the very things for which most people pay architects.

With the controversy, in slightly different forms, we are familiar. There used to be a class of critics who were sure that all would be right with our buildings if only the workmen had a say in the planning of them, and that the unnatural divorce between the head which conceived and the hand which gave effect to the conception was responsible for all the evil; and they wanted the world to believe, on the scantiest of evidence, that such was the way in which the great Mediæval cathedrals were reared. What was needed was the "master workman," the "master mason," the foreman of works, who wrought with chisel and hammer as well as designed. Then we had other critics, a little less bold, who said that all would be well if more discretion as to details were left to the artificer, and the architect confined himself to dictating the main lines of the edifice. We have a recollection of the controversy taking yet another form, some saying that there should be free trade in architecture, as in selling coals, and others maintaining that it was the duty of the Institute to protect the public from dangerous impostors, who masqueraded in the garb of trustworthy professional men. The outcome of all these controversies is tolerably simple. When, on the top of two upright stones, is laid another, when unhewn boulders are thrown together to make a monumental pile, there is no touch of art; but the moment the artificer begins to incline or curve the jambs of the lintel, the moment that he seeks to give a columnar shape to the rude mass, the region of art is entered. Henceforth, side by side the artificer and the artist ought to walk, if architecture is not to become senseless dilettantism, or to make the earth uglier than it was. Whether there should be examinations and diplomas is not now the question. Our point is, that the future of architecture will be all the better the more it is looked at from both points of view. What have been its dark ages? Those in which people had built in soulless fashion merely in order to be coarsely comfortable —in which the house and home have been made only to eat, sleep, and digest in; and those, also, in which there has been fantastic striving after far-fetched effects, and disdain of all that is simple and direct. What have been the bright days of architecture? Those in which there has been no thought of severing the artist and the artificer; in which the builder could not tell very well whether he was thinking most of honest or beautiful work; in which there has been no talk about "art architects," "scientific constructors," and "master workmen;" those in which men were not too curious to discuss whether architecture was an art or a profession, but unconsciously and without solicitude strove to build for soul and body. Why attempt to divide what ought to be indivisible? We want the architect to be neither above his business nor below it, but to be artist and man of business.

The following is Mr. Seth-Smith's judicious letter to which the *Times* refers in the preceding article:—

"It is clear that either the Royal Institute of British Architects, with its now well-established system of compulsory examinations for its own membership, is altogether on the wrong road, or that Mr. Norman Shaw and his friends, who memorialised the Institute against this system, are mistaken in their view that architecture is an art 'on precisely the same footing as painting and sculpture.'

"Those with whom I have the honour of being associated in the promotion of the movement for the legal examination of all persons calling themselves architects agree with the Institute, but desire to see the examinations made compulsory in future upon the entire profession, and conducted by a paid staff of examiners; and we further desire that the R.I.B.A., as the senior and leading professional body, should draft and introduce such a measure to Parliament.

"Now, Sir, for our reasons for agreeing with the examination policy of the Institute. Mr. Norman Shaw is correct in stating that at the present time there are three branches of professional work performed by men calling themselves architects, and we perfectly agree with him in holding that the artistic qualification is essential to a proper claim to that title, but hold that the constructional side is inseparable from the artistic, and we are convinced that a well-balanced examination in both the science and art of architecture will have the very, and very desirable, effect aimed at by Mr. Shaw—namely, of preventing men who are exclusively utilitarian constructors, or men of business, from using the title of architect.

"The tests imposed by the Royal Academy prove that it is possible and expedient to examine men in matters of taste, and I for one would not advocate any system of examinations in architecture which excluded the test of the existence of a sufficient degree of designing power (and skill in representing ideas), to insure the public against such costly disappointments as are now only too terribly common.

"As regards artistic specialism, we believe that it is impracticable to separate these three branches of practice except in the case of a very limited number of men in the metropolis and large provincial centres, just as in medical science the vast majority of men are compelled to be general practitioners; in all such matters we have to consider the question, not in the light of its bearing upon a small class of men, but for the general good; and when a man has qualified by passing the general examination, he can become a specialist either in art or in science.

"It is to be feared that the architect is, generally speaking, called in, not so much to guide in matters of taste as to secure good planning, construction, and sanitation, and it is in the exercise of his skill in these foundations of good architecture that he finds his opportunity for designing beautiful things, whereas the tendency of Mr. Norman Shaw's arguments is to reduce the architect to a mere decorator employed by the engineer or builder.

"It is a lamentable fact also that art has contributed next to nothing to the vast advantages which engineering construction has conferred upon the public, and the reputation of science has suffered proportionately among men of Mr. Norman Shaw's type; but, supposing that engineers had studied architectural art, and architects had imbibed something more of the bold, inventive spirit of the engineer, our Empire would not be disfigured, as it is everywhere to-day, with grossly utilitarian erections on the one hand, and with ornamental plagiarisms, caricatures, and deceptions on the other; we believe that such a union would have done more for architectural art than anything else could have done. The professor of architecture at the Royal Academy is perfectly right in saying that for the last 300 years architects have been groping in the dark, and that it is only in combination with constructional science that we can expect living and lasting progress in our art. "W. H. SETH SMITH,

"President of the Society of Architects."

The following rejoinder from Mr. MacVicar Anderson, P.R.I.B.A., appeared in Wednesday's *Times*:—

"In your leading article to-day you refer to those who say that 'Architecture is an art, as much as sculpture or painting,' and you describe me as being 'upon the other side of the shield,' representing the merely professional, as contrasted with the artistic, view of the question. Will you allow me to trouble you with one sentence from the address which I delivered at the Institute on the 2nd inst., in which my views are condensed:—'Architecture is not merely an art, it is not merely a science, it is not merely a profession; it is the combination in one of the artist, the constructor, and the man of business; and any who claim that it is one only, to the detriment of the others, detract from the nobility as well as from the unique character of their calling; they vainly strive to disintegrate things which are are inseparable, and which must go hand in hand.' You, Sir, conclude your article in words nearly identical:—'Why attempt to divide what ought to be indivisible? We want the architect to be neither above his busines

nor below it, but to be artist and man of business.' It is gratifying to me to find that, although—from inadvertence—you erroneously dub me an apostle of the purely utilitarian, your views are really identical with my own; and I venture to think that they will be adopted by all who impartially regard the question in the light of common sense."

Among others who have taken part in the correspondence is Mr. William White, F.S.A., who points out that Mr. Norman Shaw unfairly depreciates the endeavours of the Institute to enable its future members to exercise their art successfully, and without bringing it into discredit by way of culture, adding, "when a man has obtained his diploma the public will soon discover whether he has, or not, enough of the artist in him to carry out their commissions." Mr. T. G. Jackson reiterates his contention that architectural construction must not only be scientific, but artistic—which nobody had denied. "Art Union" suggests that the testing of architects' qualifications in construction and drawing at the Institute should be only preliminary to a higher test at the Royal Academy, where architecture is recognised as an art.

THE SOCIETY OF ARCHITECTS.

THE announcement that Mr. G. A. T. Middleton, the Secretary of the Society of Architects, would deliver a lecture illustrated by lantern views from photographs, on "The Society's Excursion into Belgium" last August, brought together a very large gathering of members and their friends, including many ladies. The President, Mr. W. H. Seth-Smith, F.S.I., occupied the chair. Before the paper was reached four nominations for membership were read, and the following eighteen new members were elected by ballot:—

Robert Annan, 19, Gayton-road, Hampstead, N.W.; James Harper Bakes, Calverley Chambers, Victoria-square, Leeds; Robert Railston Brown, Town Surveyor, Bridlington; John William Boyd, Clayton Park-square, Newcastle-on-Tyne; Charles Dempster Collins, Engineers' Dept., L.B. and S.C.Ry., London Bridge, S.E.; William Cooper, F.S.Sc., High Beach, St. Matthew's Drive, St. Leonard's-on-Sea; Maurice Alphonsus Honnessy, 62, George-street, Limerick; Joseph Henry Hirst, 77, Derringham-street, Hull; John Jackson, Barry-street, Bradford; Francis Seymour Leslie, Major R.E., War Office, Whitehall, S.W.; Arthur William Osborn, 27, Ronald's-road, Highbury, N.; Richard Lano Pearce, A.A.Oxon, Donaldson Silver Medallist, 100c, Queen Victoria-street, E.C., and Surbiton Hill, Surrey; John Todd Rea, Churchfield, Holywood, Belfast; Frederick William Roberts, Northbrook Lodge, Taunton; William John Rowell, Newton Abbott, Devon; John William Smith, 37, Ruthven-street, Cardiff; Frederick William Stevens, C.I.E., F.R.I.B.A., M.Inst.C.E., Rampart-row, Bombay; Rao Sahib Sitaram Khanderao Waidya, Bombay.

Mr. MIDDLETON then proceeded with his address, which was delivered *vivâ voce*, and with but casual assistance from notes. The illustrative photographs were taken during the tour by Mr. William Allport, F.S.I., and by Professor Henry Adams. The excursion was described and illustrated in our pages during its progress, in our issues of August 21st and 28th last. Mr. Middleton remarked:—When first it was proposed that the Annual Excursion for 1891 should take place upon foreign soil, some doubt was expressed both as to the practicability of the scheme and as to the likelihood of making such an excursion a success, even were it practicable; but as the arrangements ripened it was seen that the difficulties in the way rapidly disappeared, until at last all doubt was dispelled by our past-president, Mr. H. R. Gough, receiving a letter from the British Embassy at Brussels to say that, were we to visit Belgium, King Leopold II. would grant the members of the excursion party an audience, should he be in the country at the time of the visit. Shortly afterwards His Majesty named Saturday, August 15th, for the audience at his palace at Ostend; and therefore the excursion was arranged to commence on that day, and it was determined to remain for a fortnight in Belgium, making arrangements for the return at the end of the first week of such as could not remain longer. The journey down to Dover and the passage thence to Ostend were accomplished in the greatest comfort: but the boat was somewhat late, and it was not easy, with the imperfect knowledge of each other which the members of the party then had, to clear the custom house and to get all the luggage, and all the people too, into the cabs without the station—for the party numbered 41. Nor was it any more easy for so many to squeeze into the small house which, it being the annual fête-day, was the only place which Messrs. Gaze and Son's Lieutenant, Mr. Schembrie, had been able to provide for the necessary change of garments before the interview with Royalty. A scene of confusion followed, but it was soon over, and at the earliest possible moment the President led his following to the Palace. There the King received them in his audience chamber, shaking hands with the President, and saying a few words of welcome in English, after which the President read an address, which had been prepared and illuminated by one of the members. His Majesty replied in English at a very considerable length, pointing out what buildings should be visited during the tour, and drawing particular attention to the valuable building stones of Belgium, pointing out their suitability for use in English work. He spoke in eulogistic terms of the modern work of England, saying that our villa and cottage architecture was greatly admired by the Belgians, who were striving to follow in our footsteps. A the conclusion of his reply, his Majesty asked that each member of the party might be separately introduced to him, and to each he spoke a few words, evincing a thorough knowledge of the characteristics of the many districts of England from which they came. The audience over, no time was lost in finding the hotel, where dinner, much needed by the majority, who failed to obtain provisions on the boat, was waiting. It had to be hurried through, but time was found for a few words from the President, proposing the toast of his Majesty the King of the Belgians, which was duly honoured; and then the train for Bruges had to be sought. Arriving there, the Grand Hotel du Commerce was found not to be large enough to accommodate the party, and several members had to sleep in lodgings—but this was found to be the usual thing, almost everybody taking turn, before the tour was over, at sleeping away from the hotel. That first night, however, everyone was in good spirits. A band was playing in the "Place," and struck up "God Save the Queen," to the surprise of some fifteen of the members; but they extemporaneously formed themselves into a concert party, and sang it to the music, afterwards coming round to the courtyard of the hotel and singing there. The next day, being Sunday, was spent quietly, and everyone enjoyed the rest, wandering about the quaint old city, looking its best in the bright sunlight, or strolling into the park to hear the music. To many it was a first glimpse of Continental life, and they could have had no better introduction to it than this quiet day in picturesque and sleepy Bruges. Upon Monday morning the real business of the excursion commenced, M. Sancerie, the city architect, taking charge of the party, and acting as conductor. The first place visited was the Hotel de Ville, like all old buildings in the town, well known to tourists, but now with its elaborate front concealed from view by scaffolding—for it was undergoing restoration at the hands of M. Sancerie, whose excessively fine, small-scale working drawings were greatly admired, though most architects would prefer to use a larger scale for clearness' sake. The neighbouring Maison Grieffe was next inspected, with its gaudily-coloured Spanish front, by no means bad in its quaint design, and with its really good Renaissance chimneypiece, and the doors which formerly belonged to the Hotel de Ville. More good Renaissance woodwork was found in the Palais de Justice close by—a very bold huge chimneypiece, and some delicate carving in a large cabinet, having curious ventilation panels formed to represent interlacing reeds. After this, by way of change, the wonderful collection of lace in the Musée Grauthaus was inspected by about half of the party, the others gathering in the Place, and sketching striking details of M. Sancerie's new post-office and municipal buildings, both works of the highest order, and instinct with the local spirit of the town. When all reassembled, it was to mount to the summit of the belfry, to examine the machinery by which the chimes are played, and to take note of some fine but simple double iron gates which had once formed the doors of the muniment safes. Some time was spent there; but the morning's work was by no means finished yet: the Chapelle de Saint Sang, with its beautiful and perfectly preserved Flamboyant entran rich with carved foliage, and its unrestful coloured interior, demanding a visit; and ev then there was the great treat of the day follow—the inspection, after a hurried glar *en route* at the Place Van Eyck and the old bri traceried houses there, of the new Norm School for Girls, built quite recently under Sancerie, charming in its great variety of br tracery, softened and improved by the emplo ment of a wide mortar joint to the narrow br courses, and the non-insistence upon a perf arris, so long as the lines and curves are crisp a true. The work was of such high order, tha was felt that a great honour indeed was bestow upon the Society, when, after lunch, Monsi Sancerie expressed his willingness to accept ho rary membership, offered to him by the preside After lunch there was not much more time at disposal of the party, but a somewhat hurr visit was paid to the Cathedral, under guidance of Père Béthune, the first of m delightful ecclesiastics who were met with dur the excursion, and to the baptistery of N Dame, instinct with the best Gothic feeling, rather spoilt by its modern parapet, while m also contrived to see Memling's pictures in hospital of St. John before it was necessary take the train for Ghent. There the next was nearly as busily occupied as Monday been, the conductor throughout the day b Monsieur Van Assche, the architect for restoration of the Cathedral, over which bu ing he first conducted his visitors. In m ways imposing, and particularly remarkable the able way in which the modern work had made to harmonise with the old, yet cathedrals were yet to be seen in other to and even finer restorations by the same ar tect. Much time was spent examining de and pictures, and a good deal of attention given to two brass candlesticks of Renaiss form, said to have once belonged to Old Paul's, and to have been sold to Ghent Henry VIII.; and though this was scar credited at first, owing to their Renaiss feeling, yet the presence of the Tudor ros several places, and of the *fleur-de-lys* upon arms of England, established the date tolerable exactitude. Leaving the cathe M. Van Assche led the party to see some no schools in course of erection—much inferi those at Bruges—and into the large hall of Palace of Gerard le Diable upon the river si spacious, noble chamber, though somewhat and dimly lighted, with its double row of mas circular columns, and its vaulted roof. building is now undergoing restoration. the usual and much-respected interval lunch (for which every one was each day re the breakfasts being of a distinctly light Continental character), all steps were tu towards the ruined Abbaye de St. Bavon, i outskirts of the town—a veritable stor Romanesque and Early Gothic detail, picturesque in its present ruined state. cially some well-preserved frescoes and q encaustic tiles were noticed, as was also a curious small cross-shaped window, cle constructed of rude voussoirs, and some c foliage representing the water-lily leaf. leaving the abbey, the party split up into through the taking by some of a wrong turning did not collect again until it was time to leav town, but most buildings of interest were se everyone, though those who kept with M. Assche naturally came best off. He first le followers to the Hotel de Ville, a building o markedly different styles—Late Flamboyan Early Renaissance—the former rich i elaborate canopies and many small but st mouldings, and the latter of a bold and m type, with rusticated base, an order over, passing two stories, with banded columns, heavy crowning cornice. Little time cou spent there, however, for it was getting lat hurried visit was next paid to the Oudenbu double fortress, in two stories, each a p building of itself, now in complete ruin, bu impressive in its broad simplicity—where of Gaunt was born; and then M. Van A led the way through the ancient Butchers' remarkable for a magnificent open-timbere of the 12th century, in oak, in splendid pre tion, and rarely seen by travellers—havi all such roofs seem to have, its principal r cut where the collars are framed in. The was but a short distance to the well-known per's House upon the Quai aux Herbes—one

ıst examples extant of the Late Gothic work
'landers, and looking even more rich from
ffect of its well-coloured and much weather-
stone front, set off by equally noble but
simple buildings by its side—one Roman-
e, the other Renaissance. Rain was begin-
to fall, so that the early hour at which it
necessary to leave for Antwerp was not
ıtted so much as it otherwise would have
—that city being reached while there was
daylight. On Wednesday morning the
of assembly was the Hotel de Ville, a 16th-
ıry Renaissance structure, of no great
nal pretensions, but containing much good
rn carving in the principal rooms, which
shown by M. de Winter, the head of the
l Bureau of the Municipality. To describe
thing in detail would be wearisome, and
result little more than a catalogue; but
g much which was fine, possibly that which
nost admired was the carving in the mayor's
te room, and the original gallery to the
il chamber, though, strangely enough, no
s of access to it has ever been provided. On
ıg the Hotel de Ville there was time before
for an inspection of the lofty front of the
erroneously known as the Palace of
es V., facing the Grande Place, and for a
half-hour or more to be spent in the
angle of the Musée Plantin, quiet and
-like, very similar to many an Elizabethan
yard here in England, and most restful to
already wearying with the intricacy of the
ish Gothic detail, of which so much had
seen so hurriedly. The cathedral was
d in the afternoon, M. Baekelmans, the
tect for its restoration and other recent
there, being the conductor; but unfortu-
y that upon which he was then engaged, the
ing up of the west window with a huge
gallery, constructed of wrought iron where
stone supports are available, is by no means
criticism, though other completed work is
to his great reputation. Of the newer
perhaps the carved reredos to one of the
n chapels, by De Bock, called most largely
dmiration, though the figures upon the
stalls also received their share. The in-
on of the cathedral ended with the ascent
flag-covered roof of the aisles, which it has
d difficult to keep watertight, and a walk
the interior of the nave roof, most
sting from the opportunity which it
ed of closely inspecting its construc-
Rain was falling fast when the cathe-

or into the Church of St. Jaques—large
imple, with a rich Renaissance chancel-
. On Thursday morning the train was
to Malines, a quaint delightful little place,
one crowning feature ruling over all, and
g from all points of view the object towards
the perspective tends—the great Cathedral
When it was first sighted, on turning
ıe Place, the party which had been hurry-
wn the hill from the station, paused, and
proceeded slowly, until they reached its
and then they entered the cathedral door
antly, to be met within it by a priest of
stature and most pleasant courteous ways
Canon Von Caster, acting as representative
Archbishop of Malines. A most delight-
ıide he made over the grand old building,
he evidently knew and loved as well as
ıonk of olden days, of whom he was a
y successor, himself the architect of the
gallery under the tower at the west end,
such restoration as had been accomplished
years—all the work of a skilful, cultured
He pointed out the difference between the
d carving and the great amount of plaster
on in the capitals, the best substitute which
en found for the original work destroyed
time of the French Revolution—though
probably, better could be done. He also
ttention to a series of beautiful small
el carvings in the north transept, and
led the way up the huge tower, after ex-
g that it rested practically upon its two
alls only, the eastern being open to the
, and the western pierced by the great
oorway, these walls being but 11ft. thick,
rried only 15ft. down to solid clay founda-
ithout further thickening. From the top
iew of the town and the adjacent country
otained—and on descending, the Canon conducted the party to his private house, showing them his grandfather's original design for the completion of the tower by erecting on it a great spire almost as high again—a noble conception, which he still hopes money may be raised some day to realise. At lunch the Canon himself expressed a desire to become an honorary member of the Society—the first lay honorary member who has been admitted—and in making this request he only forestalled by a few minutes the offer which the President was about to make. After lunch a tour of the town was made, the places of minor interest to the cathedral receiving only slight attention, though several of them are worthy of protracted study. First came the small Palais de Buzsleyden, with the picturesque tourelle, and the Mont de Piété adjoining, vine covered and quiet in its Renaissance simplicity; and then the ill-restored front of the Palace of Margaret of Austria, though within the gate occurs a curious column, half-Gothic and half-Renaissance, and another quiet quadrangle. Then the Hal aux Draps, quaint in outline, broad in treatment, facing the cathedral, received but a passing glance; but a longer pause was made in the turreted museum, for there the Canon had a book to give to each member of the party descriptive of the various periodical fêtes held in connection with the cathedral. Thence it was but a few steps, and on the way back to the station, too, to the old houses on the river side, such as the Salm Inn, all studies in stone or timber, and the simple 13th-century bridge, and thence to see Rubens' great picture of the "Draught of Fishes" in the Church of Notre Dame, and yet again to pause for a moment beneath the old town gate, before leave was taken of the Canon of Malines. That night was spent in Brussels; but Friday had been laid out for an excursion to Louvain, which was reached in heavy rain, the spectacle of the military funeral of an ex-prime-minister, not contemplated when the programme was drawn up, being somewhat marred in consequence. M. Goyers, the sculptor, was the conductor here, and led the way to the cathedral, where a good deal of time was spent inspecting the interior, which contains a fine Late Gothic screen, and many pretty little bits of detail, especially in the delicate ironwork forming the locks and ventilation panels of some small cupboard doors. On leaving the cathedral, a tramp through the rain brought the party to M. Goyers' studio, a long and airy room, in which were wood carvings in all stages of execution, the figures being especially remarkable for ease of pose and perfection of execution—the best figure sculpture in wood to be seen in Europe. Unfortunately, the same could not be said for everything, some of the work being evidently taken at too low a price to allow of deep cutting, or of more than elementary outlining. In the afternoon the First Echevin, M. Fonson, received the visitors at the Hotel de Ville—a most elaborate 16th-century Gothic structure facing the cathedral, but wanting more space in front of it to display its full beauty. Now it was undergoing part restoration at the hand of M. Goyers, though it had been recased but 40 years ago by his father—an instance of the use of an ill-chosen stone. Within it seemed a marvellous pity that a rich mantelpiece, in keeping with the building, only just finished should be painted; but the first coat of colour was already beginning to be applied. It is to be hoped that the fine modern oak ceiling to the large room, and the timber pendant ceiling to the small room, opening beyond it, will be spared—they are too good to be "decorated." The rain ceasing, it was found possible to visit, in the hurried fashion usual towards the afternoon, the old Cloth Hall —a curious structure, with a grand Romanesque pillared and vaulted room occupying the ground floor, but externally with a 14th-century blind arcade at the first floor level of unique design—not arched, but straight, triangular-headed, with shallow cuspings. This was up a street which entered the Place beside the Hotel de Ville, and still further above it was found a 14th-century brick front to a house, with rich Geometric tracery, in brick, carried over the entire surface —a front which drew sketchbooks and pencils from the cases in which they had hitherto been too much confined, from want of time to sketch. Returning to Brussels, an informal meeting of the members of The Society present was held after dinner in the hotel, the visitors and the ladies being excluded, and the opinion then expressed by provincial members, whose advice is but rarely available owing to their inability to attend the sessional meetings, and their consequent modesty as to offering suggestions, will be found by close observers to bear fruit in the details of management of the Society during the coming session. Among these changes will markedly be noticed the enlargement of the Proceedings by the introduction of reports of the discussions which take place at the meetings upon the papers read. On Saturday morning, the Bourgmestre of Brussels, M. Buls, was to have received the members at the Hotel de Ville; but, in his unavoidable absence, his place was taken by his two Echevins, and by M. Wauters, the archiviste, and M. Jamaer, the architect of the city. Externally, the building seemed poor after the Hotel de Ville at Louvain, but the internal decorations, and especially the carved woodwork, the new Assembly Hall, and the method of electric lighting, both in clustered lights and by rows of lamps along a ledge above the cornice, hidden themselves from view, were well worth studying. Thence it was a good walk to the King's Palace, which His Majesty had graciously thrown open to the inspection of the members, giving orders that everything was to be shown to them, and that they were to do just as they pleased. It was a change, and a pleasant one, to wander up the grand staircase and though the spacious chambers, designed simply and in good proportion, well displayed and restful, for the elaborate decoration scheme has only been carried out in a few rooms, and notably with good effect in the great dining-room. Yet it was a disappointment to find that the walls were but of brickwork, plastered over—that, in fact, soundness and permanence of construction had been sacrificed to obtain great effects rapidly and at comparatively small initial cost. Amongst the most beautiful things seen were some inlaid tables, and a wonderful collection of Dresden china, such as scarcely exists elsewhere. In the afternoon another mark of his Majesty's graciousness was shown, the buildings at Laecken being thrown open to view. First there were the foundations of a new private church which the King is building—an octagonal erection in iron and glass, which is to have an ambulatory completely round it, forming a kind of aisle, screened off with a glass partition from the church itself, and containing flowers and creeping plants, as do now the many glass-covered corridors which will eventually connect the new church with the new palace. In the line of those conservatory passages is a great winter garden, where the constructional iron-work is treated in a simple and natural manner, decorated as iron ought to be by means suitable to the material; but the reconstruction, now proceeding rapidly, of the Palace itself, destroyed by fire nearly three years ago, is evidently upon the lines of the Palace at Brussels—a rough brick carcase, plastered over. Most of the afternoon, therefore, was devoted to the conservatories and the park, amidst beautiful plants and flowers, and in the open-air—it was an afternoon of pleasure and relaxation, spent mainly under the leadership of Mr. Knight, the King's Scotch "Director of the parks and gardens." Thus it came about that much of interest in Brussels was passed by with only unofficial notice of a few, neither the Cathedral of St. Gudule, or the new Palais de Justice receiving that share of attention which they would justly claim. Saturday evening, after dinner, was devoted to the delivery of a few speeches of a post-prandial kind, for the party was to divide on Monday morning, Sunday, of course, being given up to rest and recuperation: and on Monday, accordingly, only twenty-three continued their journey on to Mons, the remainder, unable to remain longer from England, returning direct to London. After all the good things which had been witnessed during the previous week, it is not too much to say that Mons was a disappointment. The Church of St. Wandru has a fine and dignified interior, being that rare thing, a church of one period only—the Flamboyant—and it possesses some windows of remarkable grace, and the base of its tower is almost equal to that of Malines, which it resembles; but that is all. The vaulting is of brick, and in many places crudely executed. There was a small piece of 12th-century fresco painting of some interest in the ruined Chateau of the Counts of Hainault, but after that had been seen, the rest of the day was but spent in weary pilgrimage, even the Hotel de Ville presenting little of real interest, and the hospital and school, to which M. Hubert, the conductor,

led the party, being poor both in arrangement and design. It was really a relief to take the train again and travel on to Tournai, reaching that town as it was growing dark, but not too late to be impressed with the frowning majesty of its great cathedral towers—five mighty masses rising in a group, in all the bold severity of the Romanesque. But if the cathedral had been impressive in the gloaming, it was much more so next morning when it could be seen in all its detail, the interior particularly being solemn beyond description, with its massive round-arched nave, the low columns bringing the elaborate and still perfect detail of the caps well within sight, leading up to the grand Transitional apsidal-ended transepts, and the lofty 13th-century choir beyond, and beyond that again the retro-choir of Late French character, all the different dates most plainly marked, and the various parts growing in natural and harmonious sequence, one from out the other. Yet it was not this, but the masterly arrangement of the lighting, which gave the great solemnity to the cathedral, and the broad masses of light and shadow, yet with a sufficiency of minor means of lighting to give also that air of mystery which goes further, possibly, to charm in Romanesque and Gothic edifices than any other cause alone. Altogether it was far the finest church which was seen during the excursion, its simplicity and breadth of treatment appealing strongly to the architect and artist. The conductor, too, Canon Hugnet, was all that could be wished, pointing out many a beautiful little piece of detail which otherwise would have been missed, and particularly drawing attention to the reliquaries and ancient vestments which were on view in the sacristy—a most rare privilege. Among these were a small, wood-covered diptich, inlaid with ivory, of the 10th or 11th century; a wood box with wrought tin ornaments of the 12th century, found in a shrine of that date only two years ago; and a Byzantine reliquary brought from the pillage of Constantinople, and dating back to the 9th or 10th century, its great feature being a piece of transparent enamel, of which no one present had ever seen the equal. There were also many chasubles which had been worn by historic personages, all of rich material, well designed, and the room walls were covered with fine ancient tapestry, while in the choir there were two shrines of gilded silver, made by Nicholas Verdun about 1206, of wonderful design. On leaving the Cathedral, Canon Hugnet led the way into the bishop's private chapel, adjoining the triforium, with which there is connection, a particularly well-designed chamber with 13th-century vaulting. After lunch the members scattered, many returning to the Cathedral to sketch, and others wandering about the town, inspecting the belfry, almost Byzantine in its feeling as is much of the Later Belgian work, or the beautiful 13th-century Church of St. James, with its noble interior, or the more simple one of the same date dedicated to the Madeleine, and the old water-gate close beside it, with its portcullis groove, and its corbel table, and its machicolations still remaining; but, worthy of attention as these were, it was the noble Cathedral which everyone regretted leaving when the time of departure came. That night was spent at Courtrai, and Wednesday was devoted to an excursion to Audenarde, a little town possessing the finest Hôtel de Ville in Belgium, simple in general outline, as are all these buildings, possessing but a central lantern tower rising above the steep and many-dormered roof; but its detail is more elaborate and well conceived. The photograph which forms the frontispiece to the current *Proceedings* will give some slight idea of its beauty; but it cannot reproduce the rich tints of the masonry, or the exquisite play of colour and motion as a troop of lancers passed it in bright sunshine. It was built between 1526 and 1536, in the last days of the Flemish Gothic period, by Henry Van Pee, of Brussels, but was restored fifty years ago with a friable French stone, and will soon have to be restored again. In the council-chamber the members were received by M. Paul Raepsart, the Bourgmestre, whose new house was visited later in the day; and the room was a remarkable one, containing a most wonderful specimen of Early Renaissance wood-carving in its central door, carved, but one year after the completion of the Gothic building, by Paul Van der Schelden, a native of the town, costing but £42, while a reproduction of it in the Bourgmestre's house, with cast bronze instead of timber panels, has cost £140. It may be mentioned that reproductions of the panels are to be obtained, price 50 francs each, there being twenty of them altogether. The afternoon was mainly devoted to an inspection of the Church of Notre Dame de Pamela, recently restored by M. Van Asshe of Ghent, a very beautiful Transitional building, with an external arcade to the clerestory windows and an octagonal tower, an exceptional feature being a long two-light lancet window to the south transept, carried through the triforium. It cost some £20,000 to restore—an immense sum when it is remembered how cheap both labour and materials are in Belgium; but any surprise was removed when the church of St. Walburga was seen, now in the state in which that of Notre Dame de Pamela had been before its restoration. All the old work has either been cut away or incased in solid brickwork to allow of the interior being transformed into an ugly, ill-conceived, plaster-covered Renaissance design—a specimen of the lowest depths of Vandalism. Returning to Courtrai, Thursday was spent there, the morning opening with a reception at the Hotel de Ville by the Bourgmestre. The exterior of this building is quite simple compared with others of its class, but inside are two chimney pieces which it is worth while going very many miles to see, of crisp Late Gothic detail, exhibiting strong Spanish influence, that in the Council Chamber being particularly rich, and the general effect of the room has been much enhanced by the addition during recent years of fresco paintings of rare excellence upon the walls, representing historical events connected with the town—one in a dark corner being specially remarkable for its treatment, by means of which the detail is rendered as clear as that of the paintings which catch the full light. Most of the day, however, was spent by the members in wandering about the town, sketching the tower of the ancient Cloth Hall, now inclosed by modern houses, or the quaint buildings in the Béguinage of St. Elizabeth, or the round-towered Water-gate—drinking in at the same time the rich colour effects, in the clear atmosphere, of many a pretty piece of street arrangement. In the afternoon Père Gazelle conducted most of the party over the Church of Notre Dame; but it was but another example of the casing of good Early work with bad plaster ornamentation, and the time spent there could probably have been better employed. On Friday morning, Baron Surmont de Vols Cerghe, the Bourgmestre of Ypres, conducted the members over the great Cloth Hall—a building which impresses by its enormous size, as well as by its simplicity and nobility of design, erected between 1285 and 1303. Its principal feature is the great room which occupies the whole of the first floor, in three arms, one of which alone measures 460ft. in length, while it has a uniform breadth of 38ft., spanned by a massive open-timbered roof of the character described already. To pass from great to minor features, the front of an old timber house, now erected in this room, and the mighty frescoes now being painted on its walls, some excellent modern productions, and others bad attempts, by someone who was scarcely competent, to reproduce the character of ancient Gothic work, claimed much attention; and some was also given to the modern chimney piece in the council chamber of the adjoining Hotel de Ville, which would have received more, but that better carving had been seen at Courtrai and Audenarde. The Baron then led the way to the museum for a short stay there, where some fine bits of carved detail were found, and then left the party. In the afternoon many members gave themselves up to sketching the traceried brick fronts, such as that to the Hotel du Gand, which abound in the town, but the majority proceeded to the church of St. Martin, just behind Cloth Hall—a church in quiet harmony, but not greatly remarkable, save for some unpretentious and well designed choir stalls of the 17th or 18th century, carved in low relief. The excursion was drawing to a close. There was but a railway journey to Ostend, a night spent there, and then the crossing and the separation, in most cases it is hoped to meet again next year, of a party which had grown to be like one large family. The tour had been a success in every way, largely due to exceptional facilities given everywhere, and particularly by His Majesty the King of the Belgians; while it was felt that an important step in advance had been taken in thus securing the meeting of the architects of England and those of another country, a st which cannot but be to the interest of archite and architecture generally, securing to ea country the advantage of the research and sk of the architects of the other. Of little l value, too, is the close intercourse engende during such a tour between the architects different parts of England, tending to a wideni of sympathies and the unification of practi while to all who took part in it the excurs must have left behind a feeling of pleasure o —a pleasant summer holiday, spent in pleas company, and with a definite object in view s as gives the greatest zest to pleasure, apt to p if sought for its own sake alone.

At the close Mr. Wyke Bayliss, P.R.B. proposed a vote of thanks to Mr. Middleton his very interesting and vivid description of tour, which had been relieved by many bri flashes of wisdom, wit, and humour. They all thoroughly appreciated the rich treat they enjoyed.

Mr. William Woodward, F.R.I.B. seconded the motion, remarking that it was very good fortune to form one of the forty- who took part in that most enjoyable and instr tive excursion which proved a thorough succ and he hoped to have the privilege of join other similar excursions to be arranged by Society. Criticisms had been passed that ev ing, and also in the pages of the Building N last August, on the lightness and cheapness much of the work carved in the studio of Goyers at Louvain; but M. Goyers had inform him that this was solely a question of pr He was obliged to tack on his crockets and o details, instead of working them out of the so as he would prefer, as clients would not pay additional cost of substantial work.

The President, in putting the vote of than added a few appreciative remarks on Mr. Mid ton's labours during the excursion, and obser that M. Sancerie, of Bruges, was, without do one of the finest contemporary architects Europe, all his work being distinguished evidences of refinement and erudition. chief peculiarity of modern Belgian work was thought, the great use of the three-centred w which was coming into fashion in modern Eng Renaissance work, as in the new Assize Court Birmingham.

The vote of thanks was carried by acclamat and suitably acknowledged by Mr. Middleto

THE SURVEYORS' INSTITUTION.

At the ordinary general meeting of this soci held last Monday evening at 12, G George-street (Mr. C. J. Shoppee in the ch a paper was read by Mr. J. R. Adams on " Title to Land: its Registration and Transfer

The author prefaced his remarks by ackn ledging that the idea of writing the paper been suggested to him by reading the paper w Mr. C. Fortescue-Brickdale had compiled read before the Institution during the last se (and then reported in our columns). He did wish in any way to traverse any of Mr. B dale's arguments, but rather to supplement by his present remarks. The work of the registry he regarded as most useful; but he c not help thinking that if the system were extensively adopted, it would be found that had been attempted than could be accomplis His opinion was that a register should no more than record the actual ownership, and mortgages and all other transactions shoul left to be dealt with independently of it, ju in the case of public funds and companies' s and shares. He could not agree that it was b to record mortgages as well as sales; but tho that if anything of the sort were attempted large scale it would be found to be impractic If the land registry was to succeed, it must the voluntary co-operation of those interested not by compulsion, or, if any compulsion were it must be of a kind that would be welcome not repelled. The first attempt, he believe give a Parliamentary title to land was the Encumbered Estates Act, 1858, under wh great part of the land of Ireland was sold w indefeasible title. The conveyance was made judge of the Landed Estates Court, and the chaser got a clean and clear title against a world. Here was an obvious opportuni establish a land registry; but the opport was allowed to pass by. The first Land Re Act in England was that of 1862, and Mr.

le had explained how and why it was a comrative failure. No titles were now registered der this Act; but it still governed land regised prior to the passing of the Act of 1875. der it the registrar was enabled, if satisfied t the title was such as the Act authorised him accept, to register the land with an indefeasible le, discharged of all claims, and he (Mr. Adams) ought that this principle might very well be opted now, with the result, at any rate, of largely reasing the business of the land registry. Mr. ams then proceeded to state briefly the process what is called an "Administration suit" in Chancery Division of the High Court, illusting it by the case of a man dying leaving a ll, the administration of which the parties inested desired to have carried out by the Court; rocess which he contended involved a waste of ne, trouble, and money, and he accordingly posed that the purchaser should receive, as der the Irish Encumbered Estates Act, a conyance executed by the judge, and that he uld be required (so thus far compulsion might used) to at once register that conveyance at the d registry, and have it still further confirmed a certificate of title. There would thus be no e to investigate and no conveyance to prepare, s being all done by the officials of the Court. e purchaser would simply pay his purchase ney and the stamp duty on the conveyance, l, it was obvious, could therefore afford to give etter price for the property. The effect would to substitute the purchase money for the proty sold, and to bar all persons who previously the sale were interested in the property from iming it, and to throw them back on the purse money. The court would undertake the y of seeing that the purchase money went to persons entitled to it, and, in the long run, injustice would be done. This process of subution was not a new one in legislation. Bes the Encumbered Estates Act, and the Act of 2, the General Enclosure Act, 1845, made the cel exchanged, immediately and for all purs, take the place of the one exchanged for it; l if this principle were adopted the purchaser uld be saved an expensive and troublesome intigation of title, and the vendor would be ply compensated for any extra trouble by the anced price obtained from a purchaser who w he would be spared expense. The Act sed in the last session of Parliament provided the compulsory registration of conveyances to ants in Ireland in precisely the way now pro-ed. He suggested that the transfer of land uld be modelled upon what was done in the nsfer of stocks and shares, and if it should be nd necessary hereafter to abandon the regision of dealings, other than those of absolute nership, it would only be requisite to take pretions against forgery and fraud, and to protect ocent persons from being affected by the dis-ery, after registration, of such forgery or fraud he instruments through which they claimed. next proceeded to show what were the risks lealing in registered land, and quoted the case Gibbs *v.* Messer, recently decided by the Privy ncil on appeal from the colony of Victoria, ere a system of registered title and transfer long been in operation, and where, moreover, re was an insurance fund available to meet such es of loss by fraudulent conveyance. To the posal to establish local registries Mr. Adams opposed, not on the question of principle bnt xpense, which he thought would be out of all portion to their usefulness. He proposed to the county courts as agents for the central istry, working as country banks do in transng their business through a London bank. se courts were within the reach of all, and ned to him to be the natural means by which carry on the non-metropolitan work of the istry. In dealing with the important question xpense, the author remarked that at first the s of the registry were so moderate that in 1872 aid 9s. for registering the conveyance of £2,750 th of land. In 1884 registering a mortgage for 00 on the same property cost a few shillings y, and in 1889 £6 5s. was paid to register a nsfer of this mortgage. The last fee was, he ught, much too high, and the fact that the up duty on a mortgage is 2s. 6d. per cent., on a transfer of mortgage only 6d. per cent., sufficient to show the relative value of the transactions. The land registry should, of rse, be self-supporting; but a very moderate *alorem* fee would be sufficient to pay for all it s and has to do. An insurance fund was ssary, but the premium for the very infinitesimal risk might be a small one. Any sort oi registration, if it be generally of use to and adopted by the public, must tend to reduce professional conveyancers' profits; but if it be really of value such an objection must never be allowed to stand in the way of an efficient and generally acceptable system of registration of title and transfer.

Mr. Munton, in proposing the vote of thanks, which was subsequently adopted by acclamation, said that he was somewhat surprised that the proposals for the registration of land title, which had been set forth in the paper, had been so readily adopted by surveyors. Mr. Brickdale had put the cost of obtaining a "possessory" title at 14d. per cent., and a complete title could, by his figures, be secured for about 2s. 4d. per cent. This flattering promise, he was afraid, could hardly be fulfilled. He saw no reason why the present system of accepting a presumably valid title could not be made to work as well as any possible scheme of registration, and he objected to Mr. Adams' proposals in that they involved a reference to the Court of Chancery, where no judge would pass a title so easily as it was now done. There was now very little practical difficulty in proving title, and he thought no change would be advisable.

Sir Henry Cartwright, in seconding the vote of thanks, expressed his belief that the establishment of some simple, ready and easy method of registration of title and transfer would be of immense benefit. He had had personal experience in the Bahamas of the great relief afforded to all dealing in land by such a measure, and he could only think that the clinging to old methods and old means of emolument, by the members of the profession who benefited by conveyancing, was the sole cause of the delay in the adoption of such an essentially necessary reform in England.

Mr. E. J. Castle, Q.C., said that in Scotland every deed of transfer of land must be registered in the Court of Session, and he saw no reason why the Clerk of the Peace, or of the County Council, or some other local official, might not be empowered to register the transactions in land referred to. Whether any registration at all would convey a clear title he was not sure, for he had in mind a case where land had been conveyed and re-conveyed many times, in spite of a governing deed which distinctly barred such conveyance, and he referred to another case where the freeholder having received a nominal rent per annum for premises would, at the termination of a very long lease, have had some difficulty in asserting his claim if the proposed system of granting an indefeasible title were adopted.

Mr. Adams having briefly replied to the remarks on his paper, the meeting then adjourned.

BOOKS RECEIVED.

A First Book of Mechanics for Young Beginners, with numerous easy Examples and Answers, by Rev. J. G. Easton, M.A. (London: Cassell and Company.)—Among the many treatises on mechanics for students which we have had to notice, it is somewhat difficult to pick out a good one for beginners. As a rule their authors or compilers assume too much; they take it for granted that the pupil is an adept in algebraic notation, or can solve a quadratic equation. Mr. Easton, in this very excellent little treatise, takes it also for granted that beginners know all about Euclid and quadratic equations. The belief in the youthful student's mathematical knowledge is unfortunate, for it often prevents the acquiring of an intelligent interest in this useful subject. We have yet another objection to some modern treatises, and that is the reversal of the old method of teaching. Formerly all works on mechanics began with statics and afterwards treated of dynamics; but now it is the fashion to begin with the motion of bodies and then proceed to deal with the rest of bodies. This inversion of the order has received the sanction of modern writers, and is recognised at Cambridge. We cannot say that the new method is so easy or comprehensible as the old one, which began with bodies at rest or with equilibrium of forces, and then proceeds to give a practical proof of the Parallelogram of Forces. Mr. Easton commences with kinematics, or the branch which treats of the geometry of motion. The motion of a particle, its velocity and acceleration, measurement of mass and force, is the procedure, after which the curve of velocity is dealt with, in which the proposition is given by which it is demonstrated that the space described by a moving body is represented by a given area, or the units of length in the path traversed is equal to the number of units of area. The composition of velocities which follows cannot be understood without a knowledge of trigonometry, or the ratio of the cosine of an angle. Kinetics is another branch. The laws of force and mass are a little above the requirements of many beginners. Newton's Second Law of Motion, that change of motion is proportional to the impressed force, is made to explain the Parallelogram of Forces, the dynamical proof of which is given. In this and the second part treating of statics, the examples are numerous and well selected for exercising the student's grasp of the subject. We think, however, that statical laws and principles are more readily comprehended by the student, and can be explained in simpler language. But here the author makes them follow after Newton's Laws, as being more logical. For more advanced students than mere beginners Mr. Easton's work will be acceptable.——*The London Householder's Chart*, by T. Miller Maguire, LL.D., of the Inner Temple, Barrister-at-Law (London: Simpkin, Marshall, Hamilton, Kent, and Co.), is a useful summary of the "Public Health (London) Act," 1891, which comes into operation on the 1st of January next. Dr. Maguire furnishes every householder in the metropolis with these provisions in the Act of Parliament which affect his health and comfort, by which he will be able to see what his rights and duties are. The pamphlet is divided into sections, which point out clearly all those nuisances which can be dealt with summarily by the new Act, such as accumulations, ashpits, cesspools, cisterns, drains, gutters, keeping of animals, &c.; also what the householder's remedies are, and what duties are imposed upon him with respect to nuisances. The duties of sanitary authorities in keeping streets clean, removing refuse, &c., are also given, and the penalties imposed for offences. The new regulations as to ashpits and water-closets are briefly pointed out, and the sections of the Act are given. The provisions as to water supply, infectious diseases, underground rooms, chimneys, &c., are important, and should be known by every house owner and tenant. A list of the vestries and district boards are given. As a digest or index of the Public Health Act of 1891, Dr. Maguire's little guide is also of value, as the various sections of the Acts are appended under each provision.——*Exercises for Technical Instruction in Wood-working*. Designed and drawn by H. Jay, technical instructor, Nottingham School Board, and arranged by E. R. Kidson, F.G.S., science demonstrator, Nottingham School Board (London: Longmans, Green and Co.)—These consist of a series of cards 6½in. by 5in., with carefully-drawn examples for the pupil in sawing and planing pieces of wood and framing. The first set in a case includes 32 plates, and gives exercises in preparing rectangular prisms, dividing them by the saw, making cubes, making boxes with nails, sawing obliquely, preparing prisms of octagonal and hexagonal, and many-sided shapes, cylinders. After these follow joints, half-lap, dovetail splice, making frames with half-lap joints, half-notching, mitre-joint, mortise-and-tenon joint. These exercises, it will be seen from this order, are so graduated that the pupil is taught, step by step, from the simplest operation of sawing and dividing to the more complex operations of gauging, setting out lines, and framing. Each exercise is described in words and illustrated by plan, side elevations, and isometrical perspective of the completed work. The diagrams are drawn to one scale of 6in. to 1ft. or half full-size. Set 2 contains a similar number of exercises, beginning with mitred mortise-and-tenon joints, mitred and closed, and going through various forms of joint, such as "closed and blind," "housed and tongued," dovetail joints, mitred dovetail, and several kinds of splice joints. In the third set the exercises advance to keyed mortise-and-tenon joints, "fox-tail," tusk-tenon joints, ploughing and rebating, grooving and tonguing, the framing of panelled doors and other works of joinery. The diagrams are clear and well drawn, and the views in projection are considerable aids to the pupil. We should say this form of exercises in detached plates will be valuable in all technical and board schools. The set of three cases in cloth, comprising 87 exercises, are published at 3s., or 1s. a case.

WAYSIDE NOTES.

WINTER delights are once more upon us, and the joys of fog and frost again our portion. For another season the average British householder will submit to the discomforts and miseries of a home without any means of general heating. Hence the English winter becomes, to all practical intents and purposes, more rigorous than that of a country like Canada, where, proper steps being taken for house-heating, low readings of the thermometer do not interfere with indoor comfort.

Of which fact I was reminded when reading Mr. Brodie's paper on American frame houses. Therein the author has described in outline the arrangements made for the general warming of such dwellings. A well-conceived plan is adopted from the first, with flues for the distribution of warmed air to the several apartments of the house. How seldom do we find any such arrangements in this country! Occasionally alterations are made in existing buildings; but rarely, indeed, are any attempts made to provide a system of heating at the time of construction. Yet there is no country where the warming of houses is of such importance as in these fog-girt British Isles. The Gulf Stream may have its blessings; but I doubt not but that it is also answerable for many a damp, misty day, so that if the ambition of the Yankee to deprive England of the benefits of the stream, by diverting its course, could be satisfied, we might not be without some slight compensation. Anyhow, we have an abundance of that good old English weather which so delighted the British tar coming up Channel after a long spell of the cloudless blue skies of other climes; and much we suffer from it in doctors' bills, colds, disease, and worse. Under such circumstances one would have expected to find that the first and most conspicuous feature of an English home was a well-arranged system of heating; for, much as mere cold renders such a system desirable, it is far more necessary as a protector against dampness. But we look in vain.

The hall fireplace is something; but vastly ineffectual when compared with more comprehensive systems of heating. It is an architect's apology for a proper arrangement. And as often as not this hall fireplace is designed solely as an architectural feature: I doubt whether one out of ten planners ever think of it other than as a something to add piquancy to his hall interior. Proof of this might be found in the relationship of the fireplace to the several surrounding doors, which, as ordinarily used, are calculated to create a draught past the fire, and thus draw out smoke and institute an evil that not all the genus of non-blow-down, dynamic, anti-cyclonic cowls—whose name is legion—will remedy. Consequently we find many houses where the hall fireplace is never used, and thus the only means of warming the house has to be foregone.

I would wish that these notes should instil into architects a desire to do something better in this respect. No one wants to go to America for architectural notions; but I do humbly submit that we have a lot to learn from that country in the matter of house-warming. With all our vauntings as to the comfort of English homes, we are miserably behind in questions of heating in its relation to domestic happiness. Why should we go on in the old way, undoubtedly causing avoidable ill-health, by the neglect of questions in connection with house-arrangements that are mere matters-of-course in other countries? It only shows how much of both fad and humbug there is in our day, that all sorts of elaborate contrivances are arranged in houses for the prevention of evils from sewer-gas when—in point of number of cases—enteric diseases are harmless as compared with the ravages of ailments referable to cold and damp.

I have never seen such a full meeting at the Society of Architects as that held on Tuesday last, when Mr. Middleton, the Secretary of the Society, read a most entertaining paper on the recent excursion in Belgium. If all enjoyed the reading of the paper as much as myself, then Mr. Middleton conferred much happiness on the assembly of members and friends, of whom a large proportion were of the gentler sex. It was a case of "standing-room only" by the time the lecturer commenced, and had there been many others desirous of attending, the management would have had to "turn away money from the doors," as the theatrical people say. The limelight views were excellent, and all the recognised "lions" of Flemish architecture were displayed on the sheet, besides little bits from odd nooks and crannies of the Old World cities.

Mr. Middleton has had much practice as a lecturer, and consequently the account of the Society's excursion was delivered in a pleasant, deliberate way that could not fail to hold the attention of his audience, and was just suited to the limelight method of illustration, which requires something over and above the mechanical reading of an inexperienced lecturer. A paper descriptive of ancient architecture and illustrated by views loses half its value, unless the reader possesses the faculty of making digression—explaining here a piece of construction, there a bit of detail—as he proceeds. And there was a good deal of this sort of work to do on Tuesday evening. The extent of the tour was so great, and the number of the buildings seen and illustrated so large, that the mere work of explaining the different slides was no light task. It all proved that the Society had a most enjoyable time when on their excursion, and that the members who joined the party will be quick to avail themselves of any future trips abroad that the Council may arrange.

I read of quite a death-roll of City churches in the *City Press*. St. George, Botolph-lane, is "marked for removal," and so also are the churches of St. Mildred, Bread-street; All-hallows the Great, Thames-street; and St. Michael, Wood-street; St. Olave, Old Jewry; and St. Mary Magdalen, Knightrider-street, will soon be known by name only. I am glad that people have raised their voice against the proposed wholesale demolition of the City churches. The parishioners of St. Mildred pronounced so strongly against a report which suggested the removal of their church, that the matter is in abeyance for the time. A commission, says the *City Press*, will be shortly issued to consider and report upon the expediency of a union of St. Dunstan in the East and Allhallows Barking. It is doubtful whether the commission will be bold enough to recommend the removal of either of the churches. It would be a pure act of vandalism to destroy the architecturally and archæologically interesting church at Barking, founded by St. Erkenwald, Bishop of London, in 675. And we all know that St. Dunstan in the East claims regard for its unique features and general excellence in its own way. The following churches are now closed:—Allhallows, Upper Thames-street; St. George, Botolph-lane; St. Margaret, Lothbury (for repairs); St. Martin, Ludgate-hill; St. Mary-at-Hill, and St. Mary Magdalen, Old Fish-street. St. Mary-at-Hill is said to be in a very insanitary condition; and it is also believed that St. Mary Woolnoth—only reopened on All Saints' Day last—will require to be again closed. The City churches have evidently been having a bad time lately, and are falling into the hands of enemies and others not so careful of their preservation as they might be.

The Brighton Corporation did not do a wonderfully clever thing when they let the opportunity to secure the Dyke estate slip into the hands of an American speculator, who promised to make "a veritable Paradise" of the site. Apparently, the intention is so far being realised that a couple of brick piers are being erected on the sides of the road leading from the station, with the evident ultimate destination of supporting something in the shape of a triumphal arch over the entrance into the Paradise aforementioned. Then, a post-and-rail fence is being erected where once we used to freely tread the greensward. It is all to be infinitely regretted. The Dyke was always a favourite resort of visitors to Brighton; in future, I suppose, a toll will always be charged for all wishing to stand upon the summit of the Downs at this spot, which commands the far-famed prospect over the Sussex Weald, with its hills and dales, oak glades, and many white church-spires.

I hope you will reproduce the sensible leader in Tuesday's *Times* on the "Art or Profession" question. Mr. W. H. Seth-Smith's letter in the same issue is a singularly moderate and judicious one, and for once I see it was practically echoed the next day by the President of the Institute. That is probably the future destiny of the Institute—to say ditto to the Society in regard to questions of the kind, now that it has lost its old leadership. Mr. William Woodward's letter which also appeared on Tuesday, is pregnant with sound sense, and must carry conviction to reasonable people. There is not much else worth reading in the other letters that have appeared. The gentlemen on the other side are earnest, but hardly to be taken seriously, I fancy; while the cheerful little rat-squeaks of the believers in Mrs Grundy and 9, Conduit-street, are very amusing.

GOTH.

COMPETITIONS.

ANOTHER ASYLUM FOR LONDON.—At Tuesday's meeting of the London County Council it was announced that it had become absolutely necessary to provide an additional lunatic asylum for Metropolitan pauper patients. After some discussion the Asylum Committee was authorised to expend a sum not exceeding £100 for advertising and obtaining such professional assistance as may be required to enable them to select a suitable site for the erection of asylum buildings to accommodate 1,000 patients; and further to ascertain, for the consideration of the council, the terms upon which such site may be purchased.

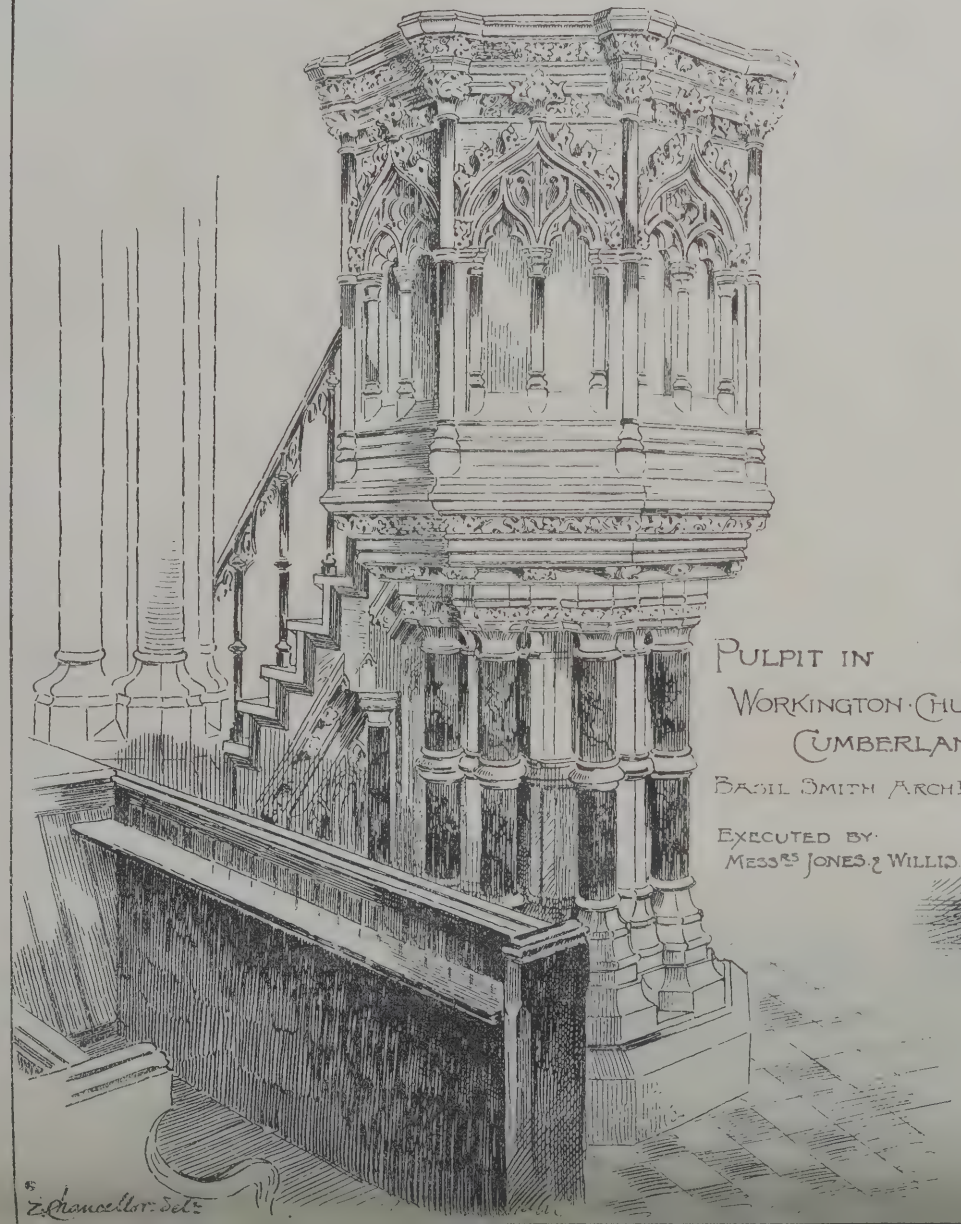
BATTERSEA.—The new Town-hall competition has been settled, and we hoped, and ought to have been able, to have given our usual review of the drawings in this issue; but on application we were informed by the Clerk that the designs could not be seen yet, but would be on view next week. The vestry meeting held on Tuesday night confirmed the award of Mr. Wm. Young, F.R.I.B.A., the referee. Mr. E. W. Mountford, F.R.I.B.A., wins the first premium; Mr. H. A. Cheers, of Twickenham, the second; and Messrs. Rees and Macdonald gain the third prize.

BRADFORD.—The design of Mr. John Jackson, architect, Barry-street, Bradford, has been accepted in public competition for the new Baptist chapel.

CADOXTON-JUXTA-BARRY.—The Barry and Cadoxton Burial Board recently advertised for plans to be submitted in competition for the erection of a new cemetery chapel on a site next to Merthyr-Dovan Church, to accommodate about 100 persons. The successful architect was to be intrusted with carrying out the work at a commission (including quantities) of 7½ per cent. The building was to cost £800, and a clerk of the works provided by the board. The second premium to be five guineas. The board met on Friday last, at the Local Board Offices in Vere-street, Cadoxton, Mr. Jno. Robinson, M.I.C.E., in the chair, when the selected design was found to be by Messrs. Bruton and Williams, architects of Cardiff and Cadoxton, and the second premium awarded to Mr. Owen, also of Cadoxton.

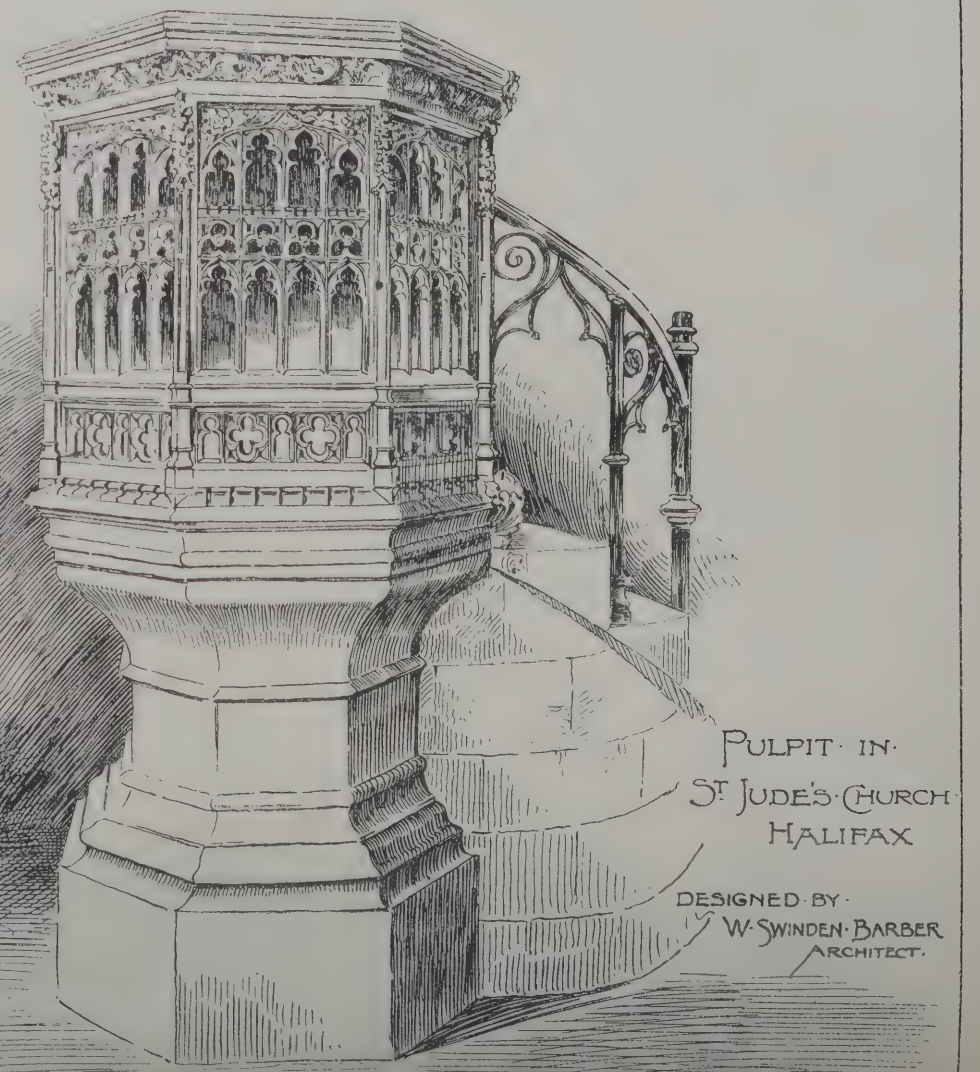
CHIPS.

At the opening meeting of the Society of Arts medals awarded by the council were presented to Col. Sir Charles Wilson for his paper on "Methods and Processes of the Ordnance Survey," to Mr. A. P. Laurie for his paper on "The Durability of Pictures painted with Oils and Varnishes," to Mr. William Simpson, for his paper on "Lithography: a Finished Chapter of Illustrated Art," and to Mr. G. T. Robinson, F.S.A., for his paper on "Decorative Plaster Work: Modelled Stuc Work."



Mr. Willson, surveyor to the local board at Ashford since May, 1884, died last week after a short illness. A special meeting of the board was held on Monday, when a vote of sympathy to the family was agreed to.

It is proposed to erect at Rhyl a hydropathic establishment containing 70 bedrooms, and the usual suites of Turkish, Russian, salt-water, and other baths. The site is at the corner of the Marine-drive and Ty-Newydd-road. Messrs. Essex and Nicholl of Birmingham, are the architects.



Mr. Preston, C.E., attended a meeting of the Wetherby sanitary authority on Thursday in last week, and laid on the table the plans for the proposed new drainage scheme for that place. The cost will be about £5,000.

On Saturday evening the first of a series of popular lectures on art subjects, promoted by the Corporation of Glasgow in connection with the galleries, was given by Mr. F. H. Newbery, headmaster of the Glasgow School of Art in the Corporation galleries, Sauchiehall-street. The subject was "Technical Processes in Art."

Our Illustrations.

ASTERN CUPOLAS AND DOMES, DRAWN BY M. ALPHONSE GOSSET, ARCHITECT.

LUME of much practical value on domes and as has been published in Paris* by M. nse Gosset, architect, to which we draw ion to-day by publishing a series of illus- ns from its pages. These reproductions, we have been enabled to make by the esy of Mr. A. Levy, who brought out the are chiefly confined to Byzantine and rn examples; but the subject in the book ich more widely treated with specimens Italy, France, England, and America, in- ig also Russian and Persian instances. We t propose to follow the author through his rate treatise, in which he traces the origin volution of the cupola. The subject is too or a mere brief epitome, and we must refer eaders to the volume itself for M. Gosset's and facts respecting it. One of the est class of domical structures are those ibtedly of the different Mohammedan nations, Morocco and Southern Spain, in Egypt, Turkey, and Persia, and India. The first is Ishoot of the Byzantine style, which was adopted and then developed by infidel ierers. The second is carred out with the ed arch, and generally with corbels instead ndentives. The cupola belonged by right to an architecture, and, as Sir Gilbert Scott sums .e history, it was continued in the same style . it became Christian, was wonderfully oped in the Eastern and Christian Roman ire; was continued in the Middle Ages in , and transplanted into Germany and ce; then it was taken up during the early of the Renaissance from the unfinished ic Cathedral at Florence, and through that Mediæval, semi-Renaissance graft was ughly adopted into the revived Classic styles. hemispherical dome does not appear to have historically the primeval type, simple as its is, but the earliest known domes assume, in n, the form of a lofty, pointed arch, as in upposed tomb of Agamemnon at Mycenæ, n centuries before the Christian era, and n Assyrian sculptures. From these till we e at the Pantheon—a simple rotunda, 142ft. nal diameter, erected in the reign of Augus- -we have scarcely any certain evidences of istory of the dome. The pendentive dome, gh occasionally used at an earlier period, lished itself about the time of the Emperor nian, and its central seat was Constantinople. earliest church remaining in that city seems to be that of SS. Sergius and Bacchus. Its dome is supported by an octagon. In section it is conchoidal, and is supported by sixteen pendentives, resembling greatly the Temple of Minerva Medica. The Church of the Apostles was a contemporary work, but it is now destroyed. The great glory of this age, however, is St. Sophia, which has never been equalled as a specimen of domical structures. The primary ideal of its design is simplicity itself, and yet the effect is one of great intricacy and of continuous gradation of parts from the arcades up to the stupendous dome, which hangs with little apparent support like a vast bubble over the centre, or, as Procopius, who witnessed its erection, described it, "as if suspended by a chain from heaven." We give an exterior view of the building as drawn by M. Gosset. The dome is lighted by forty small windows, which pierce immediately above the cornice which crowns the pendentives. When finished, its Imperial founder, in exultation, exclaimed, "Glory be to God who hath thought me worthy to accomplish so great a work! I have vanquished thee, O Solomon!" We also print a view of the apse of this cathedral. The Mosque of Sultan Selim at Adrianople, Turkey, also shown on our sheet, was erected about 1568 from the designs of an architect named Sinan. It is remarkable for its grand dimensions and picturesque outline. It is richly decorated, and cleverly constructed in brick, and faïence is introduced with marble and hard stone. The other modern work shown on our plate—viz., the Mosque of Suleiman at Constantinople—was erected in 1650, and is one of the grandest buildings of its kind in the world, with a sumptuous harem and baths. The door to the former is seen to the left of the picture, and the fountains to the right under the arcades. The mosque, built in imitation of St. Sophia's, forms a rectangle of great size, surmounted in the centre by the dome pleasingly grouped midst the minor cupolas of the composition. The accompanying interior illustrates the Pavilion of the Eight Gates of Paradise at Ispahan, which is elaborately designed in Persian splendour, with colours of the richest kind introduced in the vaultings of the dome. The only Gothic specimen of a cupola-covered structure figured on our sheet is a plan of the chapel at Ani in France, which, although of 11th-century date and Romanesque in style, surmounted by a pointed cone-like roof, in a way bears reference to the Temple of Minerva Medica. The Russian Church at Kiev is a typical work designed on the Byzantine plan, with five cupolas carried up in bulbous forms, fantastic in fashion, but singularly adapted to their surroundings. It is a curious fact that the highly-painted cupolas seen throughout Russia, crude in their primary tints—either bright blue, yellow, or red—seem to fit into their places with a wonderful quietness of effect, and it is the great ambition of those who can afford the luxury to leave large sums of money to continually repaint the exteriors of the domes of Russian churches, so that they are constantly bright and new-looking. M. Gosset's book is copiously illustrated, and has many recent specimens of Dome building represented in its pages, such as the Pavillon des Beaux Arts in Paris, and the Exhibition buildings there of 1878 and 1889. Mr. Emerson's selected design for Liverpool Cathedral is also illustrated. When bound, the work will make an uncommonly good book for reference.

*Les Coupoles d'Orient et d'Occident. Etude ique, théorique, et pratique; accompagnée de 26 hes and de plus de 70 vignettes dans le texte. Par onse Gosset, architecte. Paris: A. Levy, 13, Rue ette.

ALTAR PIECE, STALSHUND CHURCH, BLACK FOREST.

We are indebted for the photograph from which this illustration is reproduced to Dr. T. R. Allinson, L.R.C.P., the medical editor of the *Weekly Times and Echo*. The photograph was shown at the last Photographic Exhibition at the Crystal Palace, and seemed to us well worth reproduction, if only on account of the wealth of imaginative detail with which the sculptor has treated his sacred subject.

THE GRANGE, HINDHEAD.

This house, situated on the south-west slope of Hindhead, and at a height of about 800ft. above the sea-level, was built for Mr. F. Jackson, not only as a summer residence, but with the intention of being used also in winter; the dryness of the soil and atmosphere rendering this elevated position most enjoyable. For the above reasons the plan is somewhat unusual; the large central hall, two stories high, being intended to afford a means of taking some little exercise indoors in very bad weather; it also provides a suitable position for Mr. Jackson's fine organ, to receive which a recess was especially provided. This hall has also a large chimney corner, with an open dog grate, as well as a hot-air apparatus to regulate its temperature. Along the south-west side of the hall there is a verandah, with a gallery over it, and protected by the projecting drawing-room and dining-room wings, it forms a perfect sun trap; on a bright winter's day it is quite possible to have afternoon tea here in the open. Most of the other arrangements of the house will be clearly shown by the plan; but it should be noted that all the main walls are built of concrete, plenty of stones being available on the estate, and thus the very serious cost of carting bricks to such an elevated position was avoided. The general contractors were Messrs. Colls and Sons, of London and Dorking, who carried out the work under the personal superintendence of the architect, Mr. Wilfred J. Hardcastle, of 19, Surrey-street, Strand. The roof tiles were supplied by Mr. J. C. Edwards, of Ruabon, the sanitary fittings by Messrs. Doulton and Co., and some of the internal fittings by Messrs. Arrowsmith, of Bond-street.

OLD INN STAIRCASE, DEDHAM, ESSEX.

This delightful old specimen of English Domestic work was shown by Mr. Chas. F. Urquhart, of Kensington, in his beautiful bromide print, at the recent Photographic Exhibition at Pall Mall. He writes:—"The photograph is a 'bit' of the Sun Inn at Dedham, Essex, and was taken in the yard of that old-fashioned hostelry. The Sun is of a respectable age, and its appearance is that of the old-fashioned, comfortable sort of inn that one occasionally comes across in the course of one's rambles in the country. The district round about Dedham abounds in similar picturesque and quaint subjects for a picture, and to anyone wishing to spend a quiet holiday in an old-world spot, I would certainly say, Go to Dedham. As to the architectural quaintness of this particular picture, your readers will best form their own judgment."

THE NEW TRAFALGAR THEATRE.

The new theatre in St. Martin's-lane, now being built for Mr. and Mrs. Frank Wyatt, is nearly ready to be roofed in. In consequence of the various alterations required by the London County Council and the freeholder (Lord Salisbury), an entirely new elevation has had to be designed for the building which is now illustrated. The theatre is absolutely isolated on four sides, being surrounded by passage-ways entirely on its own ground. The position of the theatre in this case is saved from many of the disadvantages of isolation by there being only one public roadway (St. Martin's-lane), which is on the east side. A good deal of inconvenience in isolating small theatres arises from the fact that the noise of the traffic disturbs the performers. The theatre consists of four tiers—viz., pit and stalls, dress circle, upper circle, and gallery, and will hold in all about 1,250 persons, which, at the ordinary theatre prices, would produce about £250 per night. The interior of the theatre is of Renaissance design. The ventilation is being carried out by the same simple system which was lately so successfully used in the Albert Music Hall, Canning Town, which consists of extracting heated and vitiated air by exhausts, allowing sufficient fresh air to pass into the building through shafts arranged in the side walls. The whole construction of the theatre is fireproof, except, of course, the stage, which, however, is protected by a system of sprinklers, the whole house being supplied with numerous hydrants. There are eleven exits and entrances for the accommodation of the public. The seat coverings, silk hangings, &c., are being carried out in pale amber, backed with a warm terracotta colour. On the first-floor level there will be spacious saloons together with a smoking gallery in the open air. The dressing-rooms are erected in an entirely separate block, with staircase communication to the street without passing through the theatre, so that in case of fire they can be absolutely shut off, and the artistes escape without danger. The ante-room to the Royal box is being decorated in the style of Louis XV. period. All the more exposed portions of the stonework in the front of the building are being made of imitation stone. The drawings given show the section and plans of the theatre. The building will be lighted by electricity supplemented by gas. The act drop is being painted

by Mr. Henry Emden. The contractor for the work is Mr. Frank Kirk, of 19, Abingdon-street, Westminster, and the architect is Mr. Walter Emden, of 105 and 106, Strand.

HOUSES, THE ESPLANADE, SIDMOUTH.

THESE houses, now being built for Mr. K. R. Balfour, are intended either as lodging-houses or private residences. Local red bricks are used throughout the buildings, with pressed red bricks and stone to principal fronts; rough-cast in the gables and upper stories, with oak timber work. The contractors for the whole of the works are Messrs. R. W. and I. Skinner, of Sidmouth. Mr. R. C. Murray is the architect.

"KOWLOON POINT."

THIS building has been recently erected for Messrs. Sharp and Co., on British territory at Kowloon, immediately facing the city of Victoria, Hong Kong. It is built upon the bund, which has only recently been reclaimed from the harbour, and being upon made ground the whole of the foundations have been piled with sticks of hardwood, from 8ft. to 12ft. long, and averaging 8in. in diameter. These have been spaced 2ft. centre to centre, and have been driven by manual labour with a timber-monkey, weighing about 280lb. These monkeys are worked by 12 Chinese, with a fall of about 3ft., and deliver 20 to 25 strokes per minute. The walls are of bricks plastered, with white granite plinth, dressings, and strings, &c. Red bricks of very good quality are made at Canton, and these have been used on the ground floor, and for all arches, piers, &c., the rest of the walling being of blue bricks. The roof is covered with a double course of Canton pan and roll tiles. The joinery and flooring are of teak, and most of the carpentry is of Manilla hardwood. The first and second floors are arranged as residential chambers, each floor being complete in itself, with bathrooms, servants' quarters, &c., whilst the ground floor is designed to fulfil the requirements of godowns (warehouses). Mr. Edward A. Ram, of Hong Kong, was the architect, and the whole of the work has been executed by Chinese contractors.

TWO MODERN PULPITS.

THERE is a considerable contrast between the two pulpits represented side by side in our pages this week. Both are good in their way. The one to the left is at Workington Church, Cumberland, and was made by Messrs. Jones and Willis from the design of Mr. Basil Smith, the architect. The pulpit proper is well elevated on a base of clustered shafts, and the detail throughout is refined in character. It is made in stone, with the exception of the columns, which are of marble. The pulpit to the right forms one of the fittings in the church of St. Jude, Halifax, York. It is of a sturdier description than the other one, and designed in a later style. It is made in oak, and stands on a local stone base, and is from the design of Mr. W. Swinden Barber, architect, of Halifax, and the work has been creditably carried out by Messrs. J. Charnock and Sons, the builders of the church. We illustrated the building in our pages on Nov. 14, 1890.

CHIPS.

The University Library of Leipsic has been removed into its new premises, which have been built on the models of the Vienna and Paris libraries at a cost of £150,000.

Mr. Ralph Heaton, one of the founders and the head of the Birmingham Mint, died at his residence, Courtlands, Edgbaston, on Thursday in last week, in his 65th year, after a long and painful illness. His grandfather, and subsequently his father, conducted a prosperous business as brassfounders, stampers, and manufacturers of metal tubes, to which in 1850 was added the manufacture of coins.

The Executive Council of the County Councils Association have resolved to contribute £300 out of their funds in aid of the expenses of a test case arising out of what is known as the Warminster decision, by which county councils were held liable to contribute towards the cost of the maintenance of footpaths by the side of main roads in urban districts within a county.

Owing to the recurrence of typhoid fever this autumn at Southend, the local board of health have called in Mr. Mansergh, C.E., to examine and report upon the state of their sewers. During the past few months the sewers have been cleansed and flushed, at a considerable cost, by means of dissolved sulphate of iron.

PRICES.—XXIV.*

(All Prices Include Profit).

ADDENDA.

TO the regulations issued by the Comm'ssioners of Sewers of the City of London add the following:—

"No advertisements allowed on hoardings unless specially licensed."

"The charge for all hoards will be calculated on the assumption that they are to be 40ft. high. Any additional height will be charged according to the scale already given."

JOINER (*continued*).

VENETIAN SASHES AND FRAMES.

On Thursday in last week a new Sailors' Mission Church and Institute at Cardiff was opened by Lady Lewis. The structure, which is situated just inside the dock gates in Bute-crescent, has been erected at a cost of £6,000 by Mr. James Allen, from plans prepared by Mr. E. W. M. Corbett.

Building Intelligence.

MAIDSTONE.—On Wednesday week the Institute erected in Marsham-street by the Dowager Lady Howard de Walden, at a cost of at least £8,000, was formally declared open by the Archdeacon of Maidstone. The building has been erected on the site of a small tenement and adjoining houses, almost opposite to the West Kent General Hospital. The institute is in the Queen Anne style, and has been built by Mr. James Clements, of Maidstone, from plans by Mr. Arthur Thompson, of Leadenhall Buildings, E.C. It is of red brick, with Bath stone facings. It contains about thirty rooms, including fifteen bedrooms, lady cook's room, matron's room, laundry, stores and scullery, all of which are about 25 feet by 20 feet in dimensions, lecture hall 42 feet by 25 feet, dining-room 42 feet by 25 feet, two class-rooms 15 feet by 25 feet, kitchen 30 by 20 feet, and also baths, lavatories, &c. The building is heated throughout by hot-water pipes. The woodwork consists of varnished pitch pine, and the outer walls are all built hollow.

MAIDWELL.—After restoration, Maidwell Parish Church was reopened on Tuesday week, and a new chancel was consecrated by the Bishop of Peterborough. The old chancel was pulled down in 1791, and the altar has since stood at the end of the present nave, with a monument immediately behind it. Designs for the restoration were prepared by Messrs. St. Aubyn, Son, and Wadling, architects, Lamb Buildings, Temple, London; and the contractor was Mr. S. Grist, of Bierton, Aylesbury. The whole of the present chancel is new, and is partly built on old foundations. The walls are of local stone, to correspond with the old building, and the dressings are of Weldon stone for the exterior and Bath for the interior. The altar-table and sedilia are of oak, from a design by the architects. The whole of the fittings of the chancel are of wainscot oak, and the fronts of the prayer-desks and choir-stalls are filled in with tracery. The nave roof is new and of pitch-pine, with wrought moulded plates and circular ribs, filled in with curved wind-braces. The tower arch has been opened out to the nave and is enclosed by an oak screen, the upper parts of which are filled in with lead glazing. The nave is fitted up partly with the old oak seats, and the remainder is of new pitch-pine seats, the floors underneath being of wood blocks. The pulpit has been restored, and has a new moulded Bath stone base and Portland stone steps.

WIGAN.—The fine Italian Church of St. John, Wigan, built about the year 1820, has been embellished by the erection of new altar rails of marble and alabaster, and the sanctuary has been also enlarged. The work was placed in the hands of Mr. C. Hadfield, architect, of Sheffield, from whose designs the whole has been carried out. Mr. Preston is the contractor, of Wigan. The rails are of bold design, and follow the architectural lines of the chief features of the church, being straight in front but curved at the sides, and upwards of fifty-two feet in length. The balustraded portion is composed of light coloured alabaster of the finest quality, relieved by panels of Seravuzza marble. The base and broad capping of the balustrade are formed of richly tinted and veined rouge griotte, while the step and riser on which they stand is dove marble.

A commission is about to be issued to consider and report upon the expediency of a union of St. Dunstan-in-the-East and All Hallows, Barking. The latter is one of the very few remaining churches in the City containing Norman and Early English work, and the former church is one of Wren's works, and is widely known by its picturesque open lantern-work spire.

Major-General E. Phipps Carey, R.E., attended at the Birkdale Town Hall on Tuesday, to inquire into the application of the Birkdale Local Board for power to borrow £18,960 for works of sewage disposal, surface drainage, and street improvement. There was opposition of an extraordinary character, the Corporation of Southport, the Southport Company House Proprietors' Association, numerous hotel and other companies, and private property owners in Birkdale and Southport opposing the application so far as the disposal of the sewage went. It was stated that the scheme was prepared by the late Sir Joseph Bazalgette, and after hearing evidence in support of the application, the inspector adjourned the inquiry till December 14.

Engineering Notes.

Avonmouth.—The first sod of an extension of the dock was formally cut last week. The extension is to be 700ft. by 130ft. The walls will be of cement concrete, faced with masonry, with a coping of granite. Foundations will be put in for coaling tips, and the material excavated will be used for making up the low-lying ground between the existing dock and the ground let to the Petroleum Companies. The extension of the dock, which is being carried out from the plans of Mr. J. M. McCurrick, the docks engineer, will cost £60,000.—The Bristol Docks Committee also inspected on Monday the transit shed which has been erected on the west side of the dock. The structure is now ready for use. This is the third shed which has been constructed here, and is in length 321ft., the width being 101ft. The width of the lower portion is reduced by the line of rails at the front and back to admit of grain being delivered directly into trucks by means of shoots from the upper floor. The side and end walls of the lower portion of the shed are constructed of brickwork, and the sides of the upper portion of the shed are supported by cast-iron columns and continuous wrought-iron girders. The upper ends of the shed are of framed timber, and the sides, ends, and roof of the upper portion of the shed are covered with corrugated iron. The roof is of two spans of over 50ft. width, the principals being of wrought iron. The contractor, Mr. A. Krauss, of Russell Town, St. George, Bristol, carried out the whole of the work except the corrugated iron, which was supplied by Messrs. J. Lysaght and Co., Limited. Messrs. Milburn, of Stalybridge, furnished the cast-iron columns. The cost of the shed has been about £11,000.

Lancing.—The sea has been steadily encroaching on the frontage of the parish of Lancing, Sussex, and has frequently made gaps in the road between Worthing and Lancing. The gap now extends for a distance of about 400ft., and measures from 10ft. to 15ft. deep, and the frontage of about 1,500 yards has no protection against the encroachment. After years of discussion, a committee has been formed, partly of members of the Worthing town council, and partly of some of the inhabitants of Lancing and others interested; and the committee have instructed Messrs. R. B. Grantham and Son, of London, to prepare plans and specifications for the construction of a number of groynes and other works for the protection of the frontage. The groynes are to be laid out on the principle which has been adopted with great success on that coast between Lancing and Shoreham and Middleton parish, near Bognor.

The Ribble Works.—Mr. A. F. Fowler, the resident engineer, has reported to the town council of Preston on the desirability of protecting the river Ribble banks on the south side for about two miles below the Preston Dock. The object is to protect the surface of the soil from the abrading action of currents and the wash of steamers, and to prevent the slipping down of the banks into the dredged channel, consequent upon the deepening of the same. The abrasion of the banks during the last twelve months has been very marked. It encourages deposit, and, judging from the experience gained in dredging through this portion of the channel, prevents the attainment of the 1883 depth to a greater bottom width than 150ft., because, in order to preserve a greater width, the sides would have to stand at a steeper slope than they do at present. The engineer now recommends that the pitching of the slopes be proceeded with according to his plan, which shows the banks to be pitched with stone rubble to a slope of 2 to 1, and the base of the pitching to be protected with 12in. square piles, 20ft. in length, driven 9ft. apart, the spaces to be filled up with old sleepers.

At the last meeting of the City Court of Common Council, it was resolved to lend to the forthcoming Victorian Exhibition in Regent-street, portraits, busts, and works of art belonging to the Corporation, and illustrative of the fifty years of her Majesty's reign.

At the Wakefield police-court on Friday Edward Clarkson Tattershall, architect, was charged on remand with threatening to kill his father, a master plasterer. Defendant having promised to mend his ways and sign the pledge, the case was adjourned or three months.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Bolton Master Builders' Association.—The annual meeting of the members of this association was held last week. Mr. Wm. Townson was appointed chairman, in the unavoidable absence of Mr. Wm. Bryce, president of the association. The secretary (Mr. Fred. W. Briscoe) read the annual report, which stated that the past year had been one in which there had been an increased amount of trade, but at prices still too low. A number of questions had arisen between the employers and operatives with regard to alteration of rules and wages. After a number of meetings and interviews it was agreed that the wages of joiners and carpenters be increased from 8d. to 8½d. per hour, and the rules (particularly in respect to overtime) were amended and signed by the employers and operatives. In October last a fresh question was raised on the overtime rule. The wages and timber price list had also been revised, the new list coming in force on October 1 last. In April last notice was received from the operative bricklayers for an increase of wages from 8½d. to 9d. per hour, and deputations were received thereon. Though, according to rule, three months' notice should be given, to expire on May 1, for any alteration of rules, only fourteen days' notice was given. The operatives refused to abide by the rules, and there are therefore no official rules as between employers and employed in this trade. The labourers' wages have been increased from 5½d. to 6½d. per hour, and those of plasterers from 8d. to 9d., and those of plumbers from 8d. to 8½d., while a penny increase has been given to timber surveyors. The balance-sheet and annual report were adopted. The following officers were appointed for the ensuing year: President, Mr. William Bryce; vice-president, Mr. Councillor Cunliffe; deputy-president, Mr. Wm. Townson; treasurer, Mr. J. H. Marsden; auditor, Mr. Jas. Gregson.

Edinburgh Architectural Association.—The opening meeting of the session of this association was held on Thursday night in last week, at 42, George-street, Mr. John Kinross, president, in the chair. The president, in his opening address, stated that the membership now numbered about 300. He explained the steps which had been taken for the establishment of a school of design to give some practical instruction in the principles and history of applied art. Circulars had been issued asking subscriptions to raise a fund of £2,000 to defray the expenses of the classes for five years from the start, and during which time the practical utility of the classes would be shown and time given to establish them on a permanent basis. Taking architecture, the course of study might be the civil and ecclesiastical and military architecture, divided into lectures on the history and development of the various branches and the external influences affecting them. The course of study prescribed in architecture was to apply to the other subjects with slight variation in detail. The formation of a museum and library of decorative and applied art would also be one of the objects to be kept in view. A gratifying response was made to the appeal for subscriptions, £1,385 having been received by 30th April last. Satisfactory assurances had also been received by the committee that the scheme was being favourably entertained by the Board of Manufactures, and the necessary accommodation at the Royal Institution had been set apart for the association and for the classes. The developing and carrying into practice of the committee's broad scheme of education must, of course, take some little time. If their scheme bore fruit, the large amount of money sent South to pay for the highest class of workmanship, which could only be got there, would then remain in Scotland. Professor Baldwin Brown moved a vote of thanks to the President, along with an addendum to the effect that the association had heard with great pleasure the report as to the progress of the proposed school of design, and viewed with the heartiest approval the proceedings that had already been taken. Mr. H. F. Kerr, architect, seconded the motion, which was unanimously adopted.

Glasgow Archæological Society. — The thirty-fifth annual meeting of the Glasgow Archæological Society was held on Friday night, Mr. John Honeyman, F.R.I.B.A., president, in the chair. The annual report detailed the work of the society during the year. After its adoption, and the election of Professor Ferguson, of the Chemical Chair of Glasgow University, president, the other office-bearers were elected Mr. Honeyman then delivered a short retiring address.

Leeds and Yorkshire Architectural Society.—The sixteenth session of the Leeds and Yorkshire Architectural Society was opened at the Law Institute, Albion-place, Leeds, with an address by Mr. W. H. Thorp, F.R.I.B.A., who had been re-elected president. He proceeded to consider the question which had created a large amount of discussion and warmly-contested argument during the past year—namely, "Architecture: an Art or a Profession." He thought that impartial critic could not fail to admit that architecture had a two-fold aspect, and to exalt the one at the expense of the other was to inflict injury on both. Mr. G. B. Bulmer moved a vote of thanks to the president for his address. Mr. E. J. Dodgshun seconded the resolution which was adopted.

CHIPS.

The ceremony of laying the first stone in the works to be carried out in the front of Ramsgate at a cost of £60,000 took place on Monday. The work consist in the building of a front approach to the top cliffs, the construction of a military road across the inner harbour, and the widening of the approach to the London and Chatham Railway station, together with the building of a new Custom-house and harbour-master's house. The engineer is Mr. Valon, and the contractors are Messrs. Denne.

Mr. H. S. Marks's picture, "A Select Committee," a humorous study of a group of parrots shown at the last Royal Academy Exhibition, has been purchased by the Liverpool Corporation for the permanent collection of the Walker Art Gallery.

The town council of Tynemouth have adopted plans, prepared by the borough surveyor, for alterations to the town-hall, estimated to cost £3,000.

A new Wesleyan chapel at Buerton was opened on Tuesday week. It is Gothic in style, seats 2 persons, and cost £800. Mr. John Matthews, Nantwich, is the architect.

A new Wesleyan chapel at Highgate, near Heden Bridge, in the West Riding, was opened Sunday week. It is seated for 200 people, and the rear are schools for 160 children. Mr. W. Cockcroft was the architect, and the works have been carried out by local contractors at a cost £700.

Powers for the construction of a new dock on the Cardiff East Flats are to be sought in the ensuing session of Parliament. This new dock is to be built, at an estimated cost of from £700,000 £1,000,000, adjoining and leading into the Roath Dock, to which in area it will be almost similar. The dock will be constructed on the foreshore, the ground adjacent being in process of reclamation. It will be at right angles to the Roath Dock, and will be in direct connection with the lines of railway serving the Bute Docks.

At Marsworth, near Aylesbury, on Thursday last week, a window was dedicated, which has been filled with stained glass by the parishioners and others, as a memorial of the labours of the present vicar, the Rev. F. W. Ragg, who, with his own hands, has carried out, during the past ten years, the restoration of the battlements and buttresses, roofs, and windows of the church, being his own architect and mason.

The Marquis of Bute has presented to the Corporation of Cardiff a loving cup. It stands 32in. high, is in silver gilt, with gold shields, and profusely jewelled with diamonds, sapphires, amethysts, rubies, emeralds, carbuncles, and aqua-marine. On the top is a figure representing Cardiff, wearing a mural crown in diamonds, the face, hands, and feet enamelled in life colours—the right foot resting on a block of coal, and the left hand grasping a rudder. At her feet is a figure of Sabrina, the nymph of the Severn. The cup was designed and modelled by Mr. W. Birnie Rhind, of Edinburgh, and the work was executed by James Crichton and Co., of George-street, Edinburgh. The cost was £2,000.

Memorial stones of a new Presbyterian Church, Spellow-lane, Walton, near Liverpool, were laid on Saturday. The buildings consist of a church seating 400 people, school and classrooms and vestries. The plan of the church is cruciform, the nave being 57ft. by 36ft., and the transept 15ft. by 9ft. The ceiling is of octagon shape, and the pews of pitchpine. All the entrances will be paved with Edwards's Ruabon encaustic tiles. The exterior will be carried out in local grey brick. The style is Romanesque. The contractors have been Messrs. Haugh and Pilling, Watmough-street, and the architect is Mr. Richard Owens, Westminster Chambers, Liverpool. The total cost has been £1,800.

TO CORRESPONDENTS.

do not hold ourselves responsible for the opinions of correspondents. All communications should be wn up as briefly as possible, as there are many mants upon the space allotted to correspondents.]

s particularly requested that all drawings and all unications respecting illustrations or literary matter d be addressed to the EDITOR of the BUILDING , 332, Strand, W.C., and not to members of the by name. Delay is not unfrequently otherwise d. All drawings and other communications are at contributors' risks, and the Editor will not take to pay for, or be liable for, unsought contribu-

ques and Post-office Orders to be made payable to SSMORE EDWARDS.

NOTICE.

ıd volumes should be ordered early (price Twelve illings each), as only a limited number are done . A few bound volumes of Vols. XL., XLI., XLVI., LIX., L., LI., LIII., LIV., LVIII., LIX., and LX. ıy still be had, price Twelve Shillings; all the other und volumes are out of print. Most of the back num-rs of former volumes are, however, to be had singly. bscribers requiring any back numbers to complete lume just ended should order at once, as many of em soon run out of print.

EIVED.—J. W. and Son.—C. and Co.—M. and Co.—T.

SMYTHSON. (The drawing by Mr. Claude de Neu-lle, of Magdalen Tower, Oxford, now on view at Mr. endoza's gallery, will appear in our pages after the ose of that exhibition.)

"BUILDING NEWS" DESIGNING CLUB.

SECOND LIST OF SUBJECTS.

A small house for an artist, with a spacious studio, ving a large window facing the north. Cost of build-g to be about £800. Accommodation to comprise a od living room, measuring somewhere about 18ft. by ft., a small square-shaped hall, and staircase 3ft. 6in. ide. Kitchen and offices. Four bedrooms, bath-om, and w.c. on first floor, and the studio on the top or, with a small property or box-room leading out of . The upper flight of stairs may be 3ft. wide, and it to be remembered that pictures have to be brought wn from the painting-room. Site to be a suburban ıe, 35ft. wide and 110ft. deep, one of a row. Frontage ıe 12ft. from fence line. Style suitable for cement-ced walls, with stone dressings to the front and side indows. Scale 8ft. to the inch. Three elevations, section, and 3 plans with sketch.

AWINGS RECEIVED.—"Nil Nisi Bonum," "La Cigale," no name and address, "Old Postage Stamp," Jamrach," "Norman," "Yorkshire Tradition," Mars," "Pastime," "Cottonopolitan," "Unsate ortior," "Western," "Sector," "Sanitas."

Correspondence.

"ROGERS v. JAMES."

To the Editor of the BUILDING NEWS.

SIR,—The decision of the Judges of the Appeal urt in the cause "Rogers v. James," decided the 17th inst., and reported in the *Times* of following day, is, I think, of sufficient erest to the architectural profession to bear ne comment.

The plaintiff, an architect, sued the defendant · £120, balance of professional fees, the major rtion for designing and carrying out furniture d decorative work for which he charged 10 per it. Upon this claim a special jury at Maid-ne by their verdict awarded £58. The de-ıdant, James, set up a counter-claim of £1,000 for negligence on the part of the plaintiff, and the verdict of the jury awarded him £90.

It was proved on the trial that the contractor, taking advantage of the absence of the architect, who paid daily visits at the time, had omitted some portions of the concrete under the footings, and this was not discovered until too late to insert it. The subsoil is a hard, compact gravel, and that concrete is not necessary for the stability of the structure is proved by the fact that the walls, having been erected three years, do not show any sign of settlement. The architect having this fact before him, considered that the justice of the case would be met by deducting from the final certificate a sum equal to the cost of underpinning the walls in cement where it might be necessary. This he was empowered to do under the clause of the contract providing that "the decision of the architect with respect to the amount, state, and condition of the works actually executed, and also in respect of any and every question that may arise concerning the construction of the present contract, or the plans and specifications, or in anywise relating thereto, shall be final and without appeal."

That the judgment of the architect was correct has again been proved by the fact that the defendant, having put into his pocket the amount allowed for underpinning, has not thought it necessary to expend it.

But when the architect sues for the payment for his services, then comes up the counterclaim, and it is argued that he is responsible for the fraudulent acts of the builder (who is a bankrupt), although the final certificate has been accepted by both parties, and ratified by the Court of Queen's Bench.

The lessons to be learned by this case are:—

1. In the absence of a clerk of the works, an architect must be on the works during the entire hours of labour, thus preventing him from carrying out more than one work at a time.

2. The architect is responsible for any deficient work put in and covered up during his absence.

3. The client can claim from the builder the value of any work omitted, and having obtained it, he can again claim it from the architect. (In this case the amount claimed by the builder was over £700, and the amount of the final certificate was £160, the original contract amount being £1,900.)

The building in question is a house called "Ellesmere," erected on Sundridge-avenue, Bromley, Kent.

Bromley, Kent. FREDK. ROGERS.

ROAD-MAKING MATERIALS.

SIR,—Statements have from time to time been made by quarry owners and others wishing to introduce or advocate various descriptions of stone in which they are interested, that their particular material resists a very much higher thrusting stress than other kinds, and that it is, therefore, as good as, or greatly superior to, others used for road-making purposes.

Now, our experience, as practical road-makers, leads us to quite an opposite conclusion, and we are convinced that, not only are the figures quoted in support of the above argument in many cases incorrect, but the deduction drawn from them is fallacious.

In order to prove this to others, we prepared specimens of three different kinds of stone—viz.:—

1. Common black flint, taken from a railway cutting through chalk near Grays, in Essex.

RESULTS OF EXPERIMENTS.

To ascertain the resistance to Thrusting Stress of various specimens of road-making material, by David Kirkaldy and Son, 99, Southwark-street, S.E., in 1890 and 1891, for Messrs. John Mowlem and Co.
(Blocks bedded between pieces of Pine ⅛in. thick. All carefully ground.)

Test No.	Name of Quarry and marked.	Dimensions.	Base Area.	Crushed, steelyard dropped.		
				Stress.	Per sq. in.	Per sq. ft.
Z		Inches.	Sq. In.	lbs.	lbs.	Tons.
2,522	Flint from Chalk Beds.....	4·80 2·30 × 2·80	6·44	248,200	38,540	2,478·5
2,523	Ditto	4·80 2·30 × 2·80	6·44	168,480	26,161	1,682·4
			Mean	208,340	32,350	2,080·4
Y			6·66	213,860	32,111	2,065·0
2,634	2 "Silica" (Cherbourg)	4·37 2·58 × 2·58	6·66	208,640	31,327	2,014·6
2,633	2	4·37 2·58 × 2·58	Mean	211,250	31,719	2,039·8
2,636	1 Guernsey	4·37 2·56 × 2·56	6·55	197,320	30,125	1,937·3
2,635	1	4·37 2·56 × 2·56	6·55	176,490	26,945	1,732·8
			Mean	186,905	28,535	1,835·0

2. Cherbourg stone, which is a quartzite, said to contain 93 per cent. of silica.

3. An ordinary specimen of good Guernsey granite.

These we submitted to Messrs. D. Kirkaldy and Son, the eminent testing engineers, for testing their resistance to crushing stress, and we append the results for your information.

You will see that the common black flint shows the highest resistance; Cherbourg quartzite (which is all but pure silica) comes next, and Guernsey granite occupies the third place.

Of course, the merest tyro in road-making knows there is not the slightest comparison between the durability of a flint road and that of one made with Guernsey granite, and it is, therefore, self-evident that the test of resistance to crushing stress is no indication of the wearing qualities of a stone for macadamising purposes; because, when thus tested, the admittedly worst material gave the highest and the generally-considered best material the lowest results.

As we have observed that a great many road surveyors and members of local boards attach great value to a high resistance to crushing stress, and in many cases choose a stone solely on account of its possessing this property, we have taken the liberty of sending you these remarks and figures, and trust they will be interesting to you. We think they show clearly that other qualities besides the one in question must be looked for, and that *toughness* is quite as essential as high resistance to crushing stress, the latter being generally accompanied by brittleness, leading to rapid pulverisation under the practical test of traffic.

Should anyone wish to see Messrs. D. Kirkaldy and Son's original test certificates, we shall have much pleasure in showing them. They are always at our chief office for inspection.—We are, &c., JOHN MOWLEM AND CO.

REMOVAL OF SNOW FROM TOWN STREETS.

SIR,—In reference to your interesting article in the BUILDING NEWS of the 30th ult., on the above important subject, allow me to say that I have designed and patented a portable apparatus or furnace (the drawings and particulars of which I should be glad, with your permission, to submit for your inspection), which can be taken to the roads or other places where snow has fallen, and there used so as to rapidly melt and destroy the snow as soon as it falls, and thus avoid the labour and expense of all cartage, and also the difficulty of obtaining at a short notice a sufficient number of horses and carts, and shoots, or other means of deposit—an almost insurmountable difficulty in towns. These results can be obtained at one-fifth of the cost of any other method hitherto tried. This is not surprising when the fact is taken into consideration that the principal item of cost in the removal of snow is the carting away, which my apparatus entirely saves, the apparatus being taken to the snow instead of the snow to the apparatus or to a shoot. In other words, the very desirable object suggested in your article—viz, melting the snow *in situ*—is practically obtained.

Your article gives some valuable data and particulars of the enormous cost involved and the difficulties encountered in the removal of snow from the streets of London and other towns.

Although I dare not venture within the limits of this letter to contrast in detail the cost, labour, and time occupied in getting rid of the snow by the various means mentioned by you

with the cost and labour to obtain the same results by the use of my furnaces as ascertained from actual experiment, I should like to be permitted to briefly refer to some of the principal items quoted in your article.

You show that in the parish of St. George, Hanover-square, it cost £1,000 to remove 4,500 cubic yards of snow. My apparatus would destroy this quantity for £75.

It is estimated that to remove 400,000 cubic yards of snow in ten days 4,000 horses and carts would be required daily, and the cost would be £35,000. A sufficient number of my furnaces would accomplish this work at a cost within £7,000.

In the experiment made in melting snow by steam, 204 cubic yards were destroyed in five days. One of my furnaces would melt more than this quantity in one day, at one-fifth the cost of the steam process.

The experiment with gas does not appear to have been more successful: 285 cubic yards were destroyed in 32 hours. One of my furnaces would have destroyed this quantity in one-fourth of the time at much less cost.

My snow destructors are simple and inexpensive, and the results which can be obtained from them go far towards the solution of a very important and difficult problem which has for a long time past commanded the serious attention of municipal and other authorities.

Trusting that you will insert this explanatory letter in your next issue, and that my snow-destructor, as described above, may be found by your subscribers to satisfy the requirements so admirably set forth in your issue of the 30th ult., —I am, &c., P. E. Murphy, C.E.

Elgin House, South Tottenham, Nov. 21.

CHIPS.

The stationers' premises belonging to Mr. W. S. Cowell in the Butter Market, Ipswich, are about to be rebuilt at a cost of £5,500. Mr. F. Dupont, of Colchester, is the contractor.

During the reconstruction of the woodwork in the parish church of Prestonpans, two pieces of well carved oak panels were discovered; they represent shields of the Hamilton family, and are dated 1604.

A public reading-room is in course of erection at Lymington. Mr. Gale, of that town, is the builder, and the cost will be £500.

Holman Hunt's picture, "The Triumph of the Innocents," recently purchased for the permanent collection at Liverpool by private subscription, has been placed in the Rossetti room of the Walker Art Gallery in that city, and is now open to public inspection.

A new Wesleyan mission chapel in Church-street, Hunslet, Leeds, was formally opened on Saturday. The main room is 31ft. by 54ft., and is seated for 350 persons; while on either side are classrooms of various sizes, seven in all, and a kitchen and apparatus room. The walls are of bricks, with stone dressings, and the fittings of pitch pine. Mr. G. F. Danby, of Leeds, was the architect, and Mr. B. Hutchinson and Mr. Joseph James carried out the work at a cost of £1,450.

St. Bartholomew's parish church, Porthleven, was reopened on Thursday in last week after restoration, carried out at a cost of nearly £2,000. The pews have been replaced by chairs, the floors relieved with wooden blocks and encaustic tiles for passages, and new organ-chamber and vestry erected. Mr. G. H. Fellowes-Prynne, of London and Plymouth, was the architect, and the works have been carried out under the supervision of Mr. Thomas Webber.

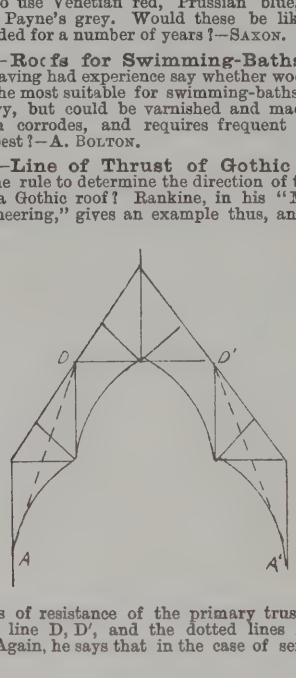
The corporation of Hythe, Kent, having applied to the Local Government Board for sanction to borrow £3,184 in order to carry out the Marine Parade improvement scheme, an inquiry was held at the town-hall on Friday morning before Colonel C. H. Luard, R.E.

On Saturday a new board-school was opened in Southesk-street, Montrose. It is provided with fourteen class-rooms on two floors; one of the rooms, to be used for drawing or cookery classes, being in a central tower at the top of the building. The accommodation is 760, and the cost has been over £6,400.

At the last Cambridge Assizes, Francis Johnson, a builder, of Fordham, Cambs, was convicted of various offences under the Bankruptcy Acts, including falsification of ledgers and cash-books, and concealment of a debt of £28 10s., and three moneys. He was sentenced to four months' imprisonment with hard labour.

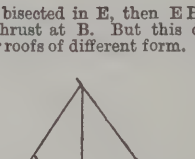
The annual dinner of the Society of Engineers will be held at the Holborn Restaurant on Wednesday, the 16th December.

Intercommunication.



QUESTIONS.

[10665.]—**Diseases of Animals in Relation to Meat Supply.**—Would some reader kindly name the best book or books on the above subject, suitable for one preparing for the Sanitary Institute Examination for Inspectors of Nuisances?—C. L. H.



[10666.]—**Permanent Colours.**—Information as to most suitable water colours to use for a drainage plan, to be framed and glazed and hung in a moderately strong light, is desired. Colours to be red, blue, green, and grey. Proposed to use Venetian red, Prussian blue, emerald green, and Payne's grey. Would these be likely to remain unfaded for a number of years?—Saxon.

[10667.]—**Roofs for Swimming-Baths.**—Will someone having had experience say whether wood or iron roofs are the most suitable for swimming-baths? Wood looks heavy, but could be varnished and made to look well. Iron corrodes, and requires frequent painting. Which is best?—A. Bolton.

[10668.]—**Line of Thrust of Gothic Roof.**—What is the rule to determine the direction of the line of thrust of a Gothic roof? Rankine, in his "Manual of Civil Engineering," gives an example thus, and says:—

"The lines of resistance of the primary truss are the horizontal line D, D', and the dotted lines A D and A' D'." Again, he says that in the case of semicircular

ribs, if A D be bisected in E, then E B would be the direction of the thrust at B. But this does not seem to help us much for roofs of different form. I want to know

the direction of line of thrust for roof, thus; and should be also obliged to any reader who would kindly give me the rule applicable to all roofs, or the name of some work in which I shall find it?—X.

REPLIES.

[10663.]—**Timber.**—"Woodenhead's" question is explained in Hurst's edition of "Tredgold's Carpentry," p. 407, where it is stated that red pine (Pinus rubra) is sometimes called by botanist's Pinus resinosa. The term Pinus resinosa in "Hurst's Tredgold" is applied to pitch pine instead of the term "Pinus rigida," given to it by some botanists, whom Mr. Laslett has followed in his work on "Timber." The authority chiefly followed by Hurst and Tredgold is, I believe, Michaux's "North American Silva," a work unequalled for accuracy by any produced by recent writers.—J. S.

An inquest on the body of Mr. William Male, plumber and contractor, and a member of the Birkenhead town council, who died, aged 54, on the 17th inst., at his residence, 14, Shrewsbury-road, Birkenhead, took place on Friday. The evidence showed that deceased had been ill for some time, and after seeing a football match on the Saturday afternoon, took to his bed and died on the following Monday. A verdict of death from natural causes was returned.

Legal.

ARCHITECTS' AUTHORITY.—IV.

In regard to certifying for payment, it is m essential that the architect should observe v carefully and cautiously the clauses and con tions of the contract, which is, as far as he concerned, the charter of his authority as ag for his client. He stands, in fact, by virtue his position, between the owner and the build and by any breach of the contract he may f that he has made himself legally liable to one the other. As to his client, his duty in certi ing is to keep strictly within the limits of authority, for otherwise his certificate may bad, and the owner not liable to pay, while h open to an action for negligence if the client paid relying upon the certificate as to val But as to progress certificates for interim p ments to the builder as the works go on, unl the contract expressly provides for and ma the architect's valuation binding upon the part it is not so, and the client is not bound that value. In this respect, indeed, builder's legal position is not very sa factory, although in practice he does very w He is obliged to get a progress certificate fr the architect before he can draw any money account under the contract; but this certific will not usually bind the employer as to the va of the work done, while it may be upset altoget by the architect himself in the final certific Nor is there any way by which the builder make either the owner or the architect liable the latter does not certify enough according the value of the work he has done under contract. In short, as to these progress cert cates they are, as a rule, merely formal conditi precedent to payments on account by the employ having no binding force upon any one, liable to be reopened and gone into all over ag at the end of the job. It is always importan keep distinct in the mind the legal position of architect as the agent of his client acting un the limited authority contained in the writ contract, and the same power as an arbitra between owner and builder, in which la capacity his powers are larger, and proceed u a different principle.

Fred. Wetherfield, Solicitor
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this colu must be headed "Building News," and m reach my offices, as above, by *Tuesday* morn to insure answer same week.

D. A. K.—Builder and Surveyor.—Profit Partnerships.—1. The surveyor arranges to do estimating, drawing, &c., for the builder for a percen of the builder's profits, and a nominal salary. builder, a practical man, wishes to take, as part of remuneration, a fixed sum per hour for his work, thi be treated as a trade expense, and a payment be ascertaining the profits. I should say he cannot do without an express agreement to that effect. 2. the arrangement as it stands, there would be a part ship in law, and the surveyor would be liable for debts; but this may be provided against by a pr agreement, which it would be advisable to enter into.

Local Board—.Powers of—Street-Making.—suming that the road is a private one, as it would ap to be, because it can't be got at without committi trespass in law, the local authority has no powe compel the owners and householders of property abut to construct the street to the satisfaction of the board. It is for the several owners to do the rep themselves, and if they care to leave the street in a state of repair, there is no remedy. Of course, i deposit of all sorts of rubbish, &c., a nuisance is cau then the local authority would have power to abate but that is a very different matter.

H. T. K.—Guardian.—Builder.—Parish Contra —1. A guardian of the poor is legally precluded f making any profit out of his position as such, and i contracts and carries out building work for the ps authorities, he forfeits his seat, and is subject to penal 2. An individual member of the board has no po outside the meetings of the board to order works done for the authority, without he is specially depute the board to do so, and I should say it would be altoge irregular for any officer of the board to appoint him agent of the authority for that purpose.

G. B. H.—Builder's Estimate—Mistake.—The take made in not carrying out the items from the Bi the Summary (on account, as it is stated, of the defau the surveyors in not including the particular work in summary), is one against which there will probabl no remedy against the building owner. All he woul concerned with would be the total, and it would be o moment to him how it was arrived at. If there claim against anyone, it would be against the surve for misleading; but as they are not bound to ma summary at all, and they do it simply for the conveni of the builders tendering, a claim against them woul my opinion, equally fail.

LEGAL INTELLIGENCE.

: School Board for London v. Johnson. he Queen's Bench on Saturday Mr. Justice an gave judgment in this case. The defendant, ohnson, of Wandsworth Common, was a r, who had done work for the London School upon three contracts in reference to as many s, and the present action was brought against recover sums amounting to £3,670 in all, in t of default in connection with the perform- f these contracts. The action came on for efore his Lordship in May last, when, after discussion, it was arranged that the dispute be referred to an arbitrator to be named by and who should report to him. He named Henry A. Hunt, surveyor, who, after having sittings, which extended over 24 days, made port, and after further consideration with the ator, his Lordship gave judgment on Saturday. ustice Denman said that the plaintiffs sued the dant to recover a large sum of money in re- of work done, or omitted to be done, by him years before the action was brought upon contracts in reference to three Board schools. lefendant had been paid upon the architect's cate, but it was contended that the London l Board were entitled to have damages, ithstanding the lapse of time that had taken , and the fact that the architect's certificate een given. His Lordship went through the tions, which provided, among other things, he contracts should be executed with the best rials and with skilful workmanship, and to the action of the architect. Further, that if n four months of the completion of the works defect arising from improper material or manship should be found, the contractor d make it good at his own cost. The certificate e architect, showing the final balance due to ontractor, should be conclusive evidence that vork had been completed, and that the balance payable; but without prejudice to the con- or being liable in a certain event. Then Clause 22, which provided that no final or ther certificate should relieve the contractor any fraud, default, or wilful deviation his contract; but that he should remain our years liable for such acts. The plaintiffs ed that there had been fraud, default, eviation from the contract, and that by reason is they had suffered loss and damage. When ase came on for trial he (Mr. Justice Denman) essed the opinion that to entitle the plaintiff to ver they must show that there had been some- in the nature of "scamping" work; and it arranged that, upon the report of the arbitrator, hould direct judgment, from which judgment e should be no appeal. The arbitrator was to rt whether the defendant had been guilty of d, default, or wilful deviation from his con- ; whether there had been "scamping" of the with a view to his own interest, or wilful ation from the contract with the same view. e the case was last before the Court, his Lord- said that he had seen Mr. Hunt, and he had no t of the correctness of the conclusions at which gentleman had arrived. He had found that defendant was not personally guilty of fraud, that to a certain extent a plumber was guilty in ng light lead in the gutters to the extent of t., and of the value of £5 5s. He reported that, rally, the work had been well done—notably, lead work, the joiners' work, the plasterers' k, and the brick and stone work; and that, ough there were serious failures in the drainage k of at least one school, he did not consider the work, as a whole, had been scamped. He referred to various deviations from the con- t that had taken place under certain circum- ces; and, in conclusion, he remarked that the cts that had manifested themselves in the dings could not have existed without the con- utory negligence of the School Board and its nts. His Lordship said that, even assuming that e was some blame to the defendant's foreman eference to work done and to deviation from contracts in reference to the drains, he thought Mr. Hunt was right in saying that it was not nded to put the money into the defendant's ket; but was due rather to the loose surveillance the foreman and clerks of work. Upon the le he (Mr. Justice Denman) had no hesitation iving judgment for the defendant, with costs n the higher scale, and also costs of two inter- itory applications that had been made.

Contractor's Appeal.—In the case of letcher v. the London and North-Western lway Company," the Court of Appeal, sisting of the Master of the Rolls and ds Justices Lopes and Kay, gave judgment Nov. 20 on the appeal of the plaintiff from order of Mr. Justice Wright, at Liverpool izes, non-suiting the plaintiff, who was seriously ured upon the defendants' line at Gorsimon ion, near Swansea, on the 6th January last. plaintiff was a sub-contractor to Messrs. Dixon Son, of Liverpool, and was engaged in removing oof when the accident happened to him. He claimed £500 damages for the breaking of his leg thoug'i being tripped up while crossing the railway at Gorsimon station, his case being that there had been negligence on the part of the company. Mr. Justice Wright non-suited plaintiff without hearing the evidence, hence the present application for a new trial. A new trial was ordered.

An Architect Charged with Obtaining Money by False Pretences. — Fred William Fryer, architect, who was acquitted of a charge of obtaining money by false pretences, was indicted at the Old Bailey on Tuesday for obtaining from James Cawthorne £100, with intent to defraud. Prosecutor was not in attendance, so the Recorder said he would postpone the trial till next sessions. Here the witnesses for the defendant raised an indignant protest, and one of them inquired if his expenses would be paid. He was going into Wales; and expense must necessarily be incurred in coming back to London.—The Recorder: Your expenses will not be paid if you are going on private business. —Witness: I am not going on business, my lord; I am a gentleman. (Laughter.)—The Recorder: That does not matter. If you are a gentleman that is no reason why you may not have private business to transact.—Witness: I am going on a visit.— Here the prosecutor walked into the Court, the counsel having left just previously. The Recorder said the case could not proceed in the absence of counsel, and he discharged the prisoner.

CHIPS.

The Bristol school board have adopted plans by Mr. W. V. Gough, of that city, for a group of schools to be built in Stillhouse-lane, near Bedminster Bridge. The buildings provide accommmodation for 300 infants and 300 boys and girls in a mixed school, and will provide a central room, 73ft. by 25ft., with a gallery at one end and classrooms on either side.

Mr. Francis F. Persse, of Sycamore Lodge, Loughrea, C.E., and A.R.I.B.A., has been appointed a Justice of the Peace for the county of Galway.

The Wakefield rural sanitary authority having adopted a scheme prepared by their engineer, Mr. Frank Massie, Assoc.M.Inst.C.E., of main drainage for the township of Lofthouse-with-Carlton, have applied to the Local Government Board for sanction to borrow the sum of £10,000, the estimated cost of the works.

The American Elevator Company have been notified by the Midland Railway Company that their proposition to erect two "Otis Standard" hydraulic high-speed elevators in the St. Pancras Hotel, in place of the existing ram machine, has been accepted, and the work is, we understand, to be carried out forthwith. The machines are to be of the regular "Otis" type, and each is to be capable of lifting a load of 1,500lb. at a high speed.

Extensive alterations and additions have just been completed at Messrs. Duck, Son, and Pinker's new premises, Queen's-road, Clifton. The work, which was intrusted to Messrs. Hayward and Wooster, contractors, of Bath, has been carried out from the designs, and under the superintendence of, Mr. E. Henry Edwards, architect, of Clare-street, Bristol.

The tercentenary of the Grammar School of Wakefield was celebrated on the 19th inst., when the foundation stone was laid of a new wing. This will, when completed, provide a chemical laboratory 33ft. by 29ft., with master's room adjoining, a lecture theatre 41ft. by 30ft., with spacious anteroom, an art room, and a gymnasium, which, occupying the entire basement, 51ft. by 39ft., will open on to the playground. Mr. Viall prepared the designs, which are being carried out under the superintendence of Mr. William Watson, architect, of Wakefield.

The Archbishop of Canterbury was the preacher on Tuesday at the reopening services of East Farleigh Church, which has been almost rebuilt at a cost amounting to nearly £6,000, Mr. J. L. Pearson, R.A., being the architect.

Alterations have been made to the town-hall, Ellesmere, embracing the ventilation, which is now carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

At a meeting of the Peterborough Cathedral Restoration Committee on Wednesday, Dean Argles offered to give £500 towards the removal of the organ to the triforium. The offer was accepted with thanks. Stalls for the choir were also accepted from the Freemasons of England, the corporation of Peterborough, and Mr. Gates, the chapter clerk.

The Rev. Canon Grainger, who recently presented to Belfast a valuable collection of antiquarian objects, for which a special building is being erected by the corporation, died on Wednesday at the rectory, Broughshahe, co. Antrim.

WATER SUPPLY AND SANITARY MATTERS.

Birmingham.—A special meeting of the City Council was held on Tuesday to consider the draft of a Bill empowering the corporation to obtain a supply of water from the rivers Elan and Claerwen in Wales. Sir Thomas Martineau, in proposing the approval of the Bill, explained that authorisation was given for borrowing £6,600,000. This amount was necessary in order to meet the requirements of the next fifty years. The first instalment of works was estimated to cost £3,340,000. The committee considered it desirable to become the owners of the water-shed itself, in order to prevent future pollution. Councillor Jarvis pointed out that the estimates had been increased a million since the scheme was last before the council. The Bill was approved, and a town's meeting will next be convened to obtain the sanction of the ratepayers.

Broxbourne.—Messrs. Bailey Denton, Son, and North, of Palace Chambers, Westminster, have received instructions from the Ware rural sanitary authority to report on the question of obtaining a good supply of water to the villages of Broxbourne and Wormley, Herts, and also upon the sewerage of the last-named village, which is without any means whatever of efficient drainage.

Godalming.—The Godalming and Farncombe Water Company have just extended their operations, inaugurated twelve years ago, by making a fresh bore-hole near Peper Harrow-road, the water being conveyed there by means of a siphon, along a 6in. main to the well at the works in Sandy-road, the distance being 869 yards. The quantity of water thus obtainable is about 6,000 gallons per hour. The work has been carried out by the contractors, under the supervision of Mr. Harris.

Lichfield.—Major-General Phipps Carey, R.E., an inspector of the Local Government Board, held an inquiry at Lichfield on Friday, with reference to an application by the city council to raise upon loan the sum of £2,500, for works of sewerage and sewage disposal. Mr. C. J. Corrie, city surveyor, explained the proposed works, which have been rendered necessary by recent lawsuits at the instance of Earl Lichfield, who, some years ago, obtained an injunction against the corporation for polluting the brook which runs through his property. There was no opposition to the scheme, and it is understood the inspector's report will be favourable.

Oldbury Sewage Works.—The Oldbury Local Board some time ago invited applications from experts with regard to laying down an improved system of sewage disposal at their outfall works. The population at Oldbury is about 20,500, and the average daily flow of sewage is computed at 500,000 gallons. Three engineers were selected to submit schemes to be sent in under motto. At the last meeting of the local board the sewage committee recommended that the scheme marked "Forward" should be adopted, that schemes marked "A1, A2, and A3" should receive the second prize, and that the scheme marked "Practical" be awarded third prize. The report of the committe was unanimously adopted. The author of the selected scheme is Mr. H. Bertram Nichols, C.E., of Birmingham. The process proposed is that known as the "International process." The existing works and land will be utilised as far as possible, the present tanks being altered in construction to adapt them to the new process. The sludge will be pressed into cakes, the necessary buildings and machinery being provided in the scheme. The cost is estimated at about £6,000.

The Lead-Poisoning at Wakefield. — The waterworks committee of the Wakefield Corporation have decided that Dr. Tidy and another expert shall be engaged to thoroughly investigate the question of alleged lead-poisoning from the use of the water supplied from the corporation works, with the object of ascertaining the cause, and applying such remedial measures as the corporation may be advised to be necessary and expedient. One of the main objects of the inquiry will be to make an exhaustive examination of the water from its source on the Rishworth Moors to the point at which it is delivered to the consumer.

New Sunday-schools, which are admirably adapted for their work, have been erected for the trustees of the Methodist Free Church, Crossens, Southport, at a cost of £1,100. The opening ceremony was performed on Wednesday afternoon, the 18th inst., by Mrs. W. Jones, of Birkdale, for which purpose a silver key was presented by the architect, Mr. G. E. Bolshaw, under whose supervision the work has been carried out by Messrs. Fenton and Fleet, of Southport.

At a general meeting of the Institute of Painters in Oil Colours, held on Wednesday evening, Messrs. Edgar Bundy, R.I., Carlton A. Smith, R.I., William Rainey, R.I., St. George Hare, Leslie Thomson, and Anderson Hague, R.I., were elected members.

Our Office Table.

From Exeter is announced the unexpected death of Mr. Alexander Stuart, M.S.A., an architect of considerable ability, and one of the most popular all-round athletes in the West of England. He died at his residence in College-road, Exeter, on Monday, after a brief illness from typhoid fever. On the death of Mr. Packman, architect, of Paris-street, Exeter, Mr. Stuart, who was then in practice in Edinburgh, joined the firm, and soon became widely known as an energetic footballer and oarsman. Mr. Stuart, who was only 35 years of age, leaves a widow and three young children. He joined the Society of Architects in 1888.

Mr. Alfred Henry Haggis, the deputy chairman of the London County Council, who died suddenly while proceeding in an omnibus to the Council meeting on Tuesday, was born in London in 1834, and was thus in his 56th year. He was the proprietor of extensive saw-mills at Blackfriars, Paddington, and Caledonian-road, but since his appointment to the office of deputy chairman of the Council, with a salary of £1,500 a year, he had practically relinquished active participation in business to his two sons. He had for the past eight years been an alderman of the borough of Croydon, and, on the formation of the London County Council, was elected as a member for West Southwark, and was chosen by his colleagues on the equally sudden death of Mr. Firth, M.P., to occupy the post of chief salaried official of the Council and head of its staff. He issued last week an exhaustive report on the scheme for intrusting the Council with the London water supply, of which he was a strong advocate.

The death is announced from Clifton, Bristol, of Mr. James Jackson Curnock, a well known landscape artist. Mr. Curnock, who was in his 52nd year, was the son of a Bristol artist, from whom he received his first instructions, afterwards studying at the Bristol Academy. For several years he was a regular exhibitor at the Royal Academy, and at most of the provincial exhibitions. At the Manchester autumn exhibitions, and at the Royal Cambrian Academy, Curnock was frequently represented by excellent work. Among his best-known pictures are "Ellen's Isle, Loch Katrine," "Loch Eornish, Isle of Skye," "Autumn," "The Idwal Mountains," "Snowdon," "The Pool below the Bridge," and "Driving down the Sheep." Of one of his works—"The Lengwy, at Capel Curig," exhibited at the Royal Academy in 1875—Mr. Ruskin remarked:—"I find this to be the most refined landscape of all here; too subdued in its tone for my own pleasure, but skilful and affectionate in a high degree. . . . A calm stream patiently studied. The distant woods and hills are all very tender and beautiful."

At a meeting of the Edinburgh Architectural Association held on the 19th inst., the newly-appointed honorary librarian disclosed the unwelcome fact that a number of valuable books had been removed from the library. In consequence of this disclosure, and as no information was left by which the books could be traced, it was reluctantly resolved to close the library in the meantime, in the hope that this decided step might lead to the restoration of some of the missing volumes. The committee are of opinion that most of the lost books are kept back through carelessness or forgetfulness, as it is hardly possible to imagine what use anyone could make, say, of such a work as "Sharpe's Parallels," plastered over, as it is, with the stamp of the association. At the same time, they are forced to acknowledge that this safeguard is not always sufficient, as a short time ago two volumes so stamped were found in an auction-room among the books of a deceased member, and were only withdrawn from sale and restored on being claimed by the secretary of the association. The librarian was directed to request the assistance of the professional journals in giving publicity to these facts.

The annual exhibition of fine arts in Dundee, opened on Saturday by the Marquis of Lothian, embraces a good display of contemporary English and Scottish pictures, as well as an interesting loan collection. The latter includes Millais's "Chill October," lent by Lord Armstrong; G. F. Watts's portrait of Sir Frederic Leighton, and works by Constable, Raeburn, and Alma Tadema. Among the general exhibits are two landscapes by David Murray, and others by Beattie, Brown, and J. McTaggart, three *genre* works, and a portrait by Ogilvie Reid, and a study of Scotch character by Gourlay Steell. In the water-colour gallery are the two last sketches made by the late Sir W. F. Douglas, "Study at Cordova," by A. Melville, and landscapes by Tom Scott and G. Johnstone. The chief exhibits in the sculpture gallery are the memorial busts of Baillie Harris and Miss Harrison executed by John Hutchison. The display as a whole is above the average of Dundee.

A minute has been issued by the Committee of the Privy Council on Education with reference to the examinations in science subjects. The number of candidates presenting themselves for examination in the science branches is so large that the machinery of examination and registration is already severely strained. These numbers will probably be soon so increased as to render it impossible to make satisfactory arrangements for examination. At the same time the means recently placed at the disposal of local authorities for providing or aiding instruction render it unnecessary for the Science and Art Department to continue to give direct aid for very elementary instruction in science. Such instruction can now be more effectually organised and maintained locally. After the May examinations of 1892, the payment of £1 now made for the second-class in the elementary stage of each science subject will therefore cease, but the payments for the advanced stage and for honours will be considerably increased. These changes, which come into operation in 1893, do not, it will be seen, affect the students in art schools.

A conference arranged by the Maidstone, Chatham, Rochester, and Strood Master Builders' Association was held recently at the Mitre Hotel, Maidstone, for the purpose of discussing and, if possible, agreeing upon a form of contract that should be more equitable and acceptable than that generally in use in the county, and for discussing other matters of interest in connection with the building. There was a large and representative meeting of the principal architects and builders of the county of Kent, upwards of 40 being present, and the chair was taken by Mr. G. E. Wallis, the vice-chairman being Mr. Callund, of Rochester. Several resolutions in accordance with the objects of the meeting were unanimously agreed to, and it was arranged to supply, as soon as possible, all architects, surveyors, and builders in the county with a copy of the same for adoption in the future.

Messrs. Goodman, Hughes, and Co. must be congratulated on the success of their opening sale on Tuesday last. Unlike other timber brokers who are in the habit of hiring a room for their sales, this enterprising firm has established a new centre by opening the Timber Auction Mart, at 44 to 47, Bishopsgate-street Without, which is directly opposite the new entrance to the Great Eastern Railway main line in Bishopsgate-street. One of our representatives viewed the hall, and was much struck by its size, shape, light, comfort, and business-like way in which it is fitted up. The catalogue consisted of 726 lots, comprising a fine selection of deals and battens, floorings and matchings, Quebec and Miramichi pine and spruce of all qualities, mahogany, cedar, walnut, oak, &c., besides sundries. There was a large attendance, including all the leading firms of the trade, and the bidding was good. The result of the sale was most satisfactory, and from what we can glean from the auctioneers themselves, it far exceeded their expectations. We understand that Messrs. Goodman, Hughes, and Co. are moving their offices to the same premises as their hall, and intend holding another sale before the close of the year.

Mr. Samuel Knight, F.R.I.B.A., writes that a small fragment of London-wall is now laid bare in the basement of the houses lately removed for rebuilding, Nos. 41 and 43, Ludgate-hill. It is but the remainder of a larger portion, forming a support to Pilgrim-street, in the rear southward, and which was lately cut away in course of building the new City Bank. It is probably a vestige of the flanking wall, shown on the ancient maps as running westward from the southern tower (or abutment) of "Lud Gate," which crossed the street at this point. Though but a fragment, it is the last which is likely to be unearthed in that locality for some time to come, and those who care to inspect it may do so—Mr. Knight adds—on application to Mr. Price, the foreman to Messrs. J. Grover and Son, the builders.

Mr. James Thomson, C.E., gave a lecture last week on "Sanitary Engineering: its Present and Future Position in Relation to the Architect's Work," at a meeting held in Edinburgh, under the presidency of Mr. J. H. Anderson, C.E., vice-president of the East of Scotland Engineering Association. The lecturer said he considered the drainage arrangements of the majority of the better class houses in Edinburgh were models worthy of imitation. Dealing with the subject of water waste, he suggested that, instead of having costly and irritating inspections of the water fittings in houses, the Water Trust should carry out experiments on a large scale for the purpose of thoroughly testing the different systems of hot-water piping. The movement for the national registration of plumbers was considered to be already showing beneficial effects in the trade. A long discussion followed, and the meeting terminated with a hearty vote of thanks to the lecturer.

The Bureau of American Republics in Washington furnishes us with information in regard to the timber industry of Honduras. The first wood-cutters in the territory went to Belize 150 years ago, and since that time Belize has been principally occupied with the various camps or mahogany works, which extend between the rivers Ulua, Chameleon, Patteck, and Wanks, on the Atlantic coast. The timbers at present most sought after for shipment are mahogany, cedar, rosewood, zebra, and fustic. Mahogany and cedar are the leading exports, and are shipped mainly to England. The price of mahogany in London ranges from 110dols. to 175dols. per 1,000 superficial feet, and cedar from 90dols. to 180dols. Rosewood, zebra, and fustic are cut into short lengths and shipped as ballast. Rosewood brings from 25dols. to 40dols., and fustic 30dols. to 40dols. The logs are squared before shipment. The timber on Government land is free to anyone who proves to the Administrator of Customs that he has ample means to transport it to market. The best season for cutting is during the rainy months, so that the logs may be ready by the beginning of the dry season, on March 1. Care is taken not to fell any trees less than 8ft. in circumference. The cutting is done by piecework, two trees from 8ft. to 12ft. being a day's work for one man, and a tree 25ft. in circumference being a full day's work for four men. Over 300 trees are sometimes felled in a camp in a single season. The carriage of lengths to the river banks is done principally at night. The export duties on mahogany and cedar are 8dols. per 1,000 superficial feet.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Arts. Cantor Lecture No. 1. "The Pigments and Vehicles of the Old Masters," by A. P. Lawrie. 8 p.m.
Royal Institute of British Architects. 8 p.m.
Leeds and Yorkshire Architectural Society. "Cements, Lias Limes, Concretes and Testing," by W. Bruce. 7.30 p.m.

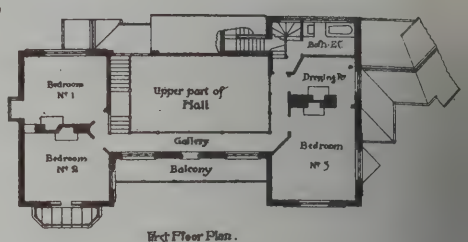
Tuesday.—Institution of Civil Engineers. Discussion on papers on "Portland Cement," by H. K. Bamber, A. E. Carey, and Wm. Smith. 8 p.m.
Glasgow Architectural Association. "Antiquities of Renfrewshire," by A. Muirhead. 8 p.m.

Whdnesday.—Society of Arts. "Secondary Batteries," by G. H. Robertson. 8 p.m.

CHIPS.

A new block has just been added to the Post-office at Newcastle-on-Tyne, on the Westgate-road side. It has a stone front, and has been built from plans by Mr. Henry Tanner, of H.M. Office of Works. Mr. John Ferguson, of St. Mary's-place, Newcastle, was the builder, and Mr. E. S. Searle the clerk of works.

Messrs. Jones and Willis have executed for St. Paul's Church, Harringay, under the superintendence of Mr. Willey, architect, of Ludgate-hill, the ornamental pendants for lighting the interior, and lamps for the outside; also wrought-iron altar-rails, standards, door furniture, and curtains, carpets, &c., for the chancel.



The Rev. C. W. Grove has offered to fill with stained glass the five large windows in the north aisle of the nave of Tewkesbury Abbey, and his offer has been accepted by the vicar and churchwardens. The new windows will match the five given by Mr. Grove in the Jubilee year in memory of his late wife, and which are in the south aisle.

The Archbishop of Canterbury will consecrate the new chancel and aisle of St. Andrew's Church, Croydon, to-morrow (Saturday) afternoon.

ID ENGINEERING JOURNAL.
VOL. LXI.—No. 1926.
FRIDAY, DECEMBER 4, 1891.

THE STUDY OF PLAN.

SERVERS of the progress which architecture has made during the last e or two must have become aware of ange in the study and practice of the Not many years ago imitation and style he leading motives. To select a model clothe a building in a certain style the main objects the designer had in It did not matter whether the build- as to be a house, a town hall, or a ı; a style was the first point to think for it was supposed to control in a easure the design of the building—even n. The process was really designing vithout inwards. Now the practice is ed: the process is to design the building he requirements of plan and construc- eaving the style to be the outgrowth latter. Indeed, plan is now recognised our great buildings as the funda- l principle and root of the design. ransference of attention from style to s only a reversion to the old system , instead of taking a resulting product rtain age or epoch, commenced at the ning by working out, step by step, the m of design. In other words, it was a ple, not a product, that the old archi- dopted with such successful results.

noters of architectural education are eginning to see the importance of the e, and to lay more stress on incul- the requirements of buildings, their ng, and construction. More attention paid to plan, for its own sake, than e case a few years ago; that is to say, plan distinct from elevation. We ber the time when an architect with hazy ideas of arrangement tried to his plan by coaxing it here and o fit his elevation. It was a matter mpromises in which the elevation predominant in the mind. Now, e contrary, we find many in the sion not very anxious to reconcile the ings. Competition designs for public ngs of late have shown many unfor- alliances between them. There is a ng conviction that well-thought-out nave the best chance of success, and re many who study their plans at the se of elevations, which latter appear as had been moulded to the outline of and made to pass muster at a short Of course, there is an evil in carry- her of these courses to an excessive Nothing can be worse or more al than to make the inner departments ms of a building subservient to the or; and there is also a danger in taking me of plan, and without further study ing elevations that will fit it. In not instances of municipal buildings, the s submitted by competitors have too ly followed the "sketch plan" which the or of the corporation has appended to nstructions," without so much as an t to modify or improve upon a plan is only given as a workable programme. leness is often a weakness of the plans e in competitions—that is to say, an imation to the proper arrangement is y thing attempted, and no time is spent sting frontages, in recasting the first draft or scheme, and in improving the of rooms or approaches. But the t wants a codified set of rules and efore the study of planning can be d with advantage. When we con- hat a plan comprises accommodation, areas, classification, division or distribution of parts, grouping, and, in one important sense, the design, the principle upon which the whole building hangs together, that cost is essentially bound up with it, we begin to understand that it forms the real germ or kernel of the whole scheme. Plan is a science as well as a fine art; it represents the same relation to the design which method and order do to a written discourse or essay. It would be difficult to give principles, as every building has its own programme and requirements. Every building has its own "keynote," or something which differentiates it from another. A domestic building has its aspects of principal apartments, its entrances, and its hall; a municipal building its offices, council chamber, police-court, and general assembly hall; a school its central hall and classrooms; a polytechnic its classrooms, workshops, general hall, swimming bath and gymnasium, each set of requirements demanding an arrangement of corridors and axes essentially distinctive, and in each case the paramount conditions of site have to be considered. One author truly says "that ground-plan, principal elevations, and roof-plan must be simultaneously studied to produce a satisfactory result," and he defines three points to be considered in the following order: 1, Position of entrance; 2, communication; 3, aspect of apartments. But we want something more definite than general principles. Those who have to tackle any of the numerous problems presented to the architect are at a loss how to proceed when precedents are scarce. One may have a notion of the sort of plan, the way of distributing the apartments or offices, but he must have facts to work upon.

These facts relate mainly to accommodation. The number of individuals or offices to be provided for, the sort of offices, and the classification are points to be determined if a municipal building is the problem; or the number and arrangement of patients in dormitories or day-rooms, if a hospital; or the size and dimensions of hall and classrooms, and the desk arrangement, if a school. These data can be only obtained by actual observation and study of buildings of the class which are not generally given in books. In competitions the superficial areas of the rooms to be provided are often given in a schedule, as for municipal buildings and public libraries; but these rough approximations of areas do not guide the architect as to the shape or proportion of room that is desirable. Thus, taking up at random the conditions published to architects in a recent library competition, the floor areas, and even cubical contents, are scheduled. Thus the lending library is to have 2,000ft. superficial, the reading-room to have 1,200ft., and the news-room the same. But what should be the actual dimensions of these rooms is left to the designer. He may elect to make his lending library 65ft. by 30ft., or 50ft. by 40ft., whichever suits his plan the best; but the proportion may not be suitable to the arrangement of the bookcases. Again, the dimensions of the reading-room ought to be decided by the number, position, and length of the tables and newspaper stands; but the area of 1,200ft. does not give any idea as to the proper length and width—say, 50ft. by 24ft. In short, the superficial areas do not provide any further information than that of mere space. A square room of a certain area may for some purposes be distinctly less appropriate and wasteful than one of an oblong shape designed expressly for the purpose, having reference to seat or bed accommodation, even though it be of less area. What is wanted, then, are dimensions of length and width rather than superficies. But these dimensions, as we have said, imply knowledge of such data as how many persons can stand or sit on a given area for purposes of public meetings or reading-rooms; how the seats, desks, and tables can be placed to afford the best results; how much area is occupied by a patient in a day-room and dormitory.

Cost, as we have hinted, is one of the facts that ought to be decided in the architect's mind before preparing a plan, and here also he is left to his own resources and often mistaken notions. To take a hospital for 800 patients: The cost per bed may vary from £150 to £250 or even more, exclusive of land; but the object of the architect, if the cost is limited, is to find how little per bed he can build it for. The area covered by the buildings must be reduced, if possible, and it is important to find out what is the minimum area of space per bed. A careful analysis of the cost and accommodation of institutions of this kind must be formed. In some cases, including land, the total cost has been about £318 per bed, as was that of the Glasgow Western Infirmary, the land alone amounting to the large sum of £60 per bed. The number to be accommodated is a factor, for a building for a few patients only would amount to a larger sum than one for a large number. In church and school building it is also convenient to know the cost per sitting or pupil, before a rough estimate can be given; but cost, in all these cases, depends on area allotted to each person, to height of building, and to class of workmanship.

Types of arrangement constitute another important study in connection with plans, and ought to form one of the subjects in the architectural curriculum. There is too much guessing and scrap-work. A plan here or there is chosen as circumstances permit, not because it is the best, but because the architect has seen a plan or a building of similar kind. The subject allows of a scientific classification. The comparative anatomist, the naturalist, and the pathologist alike make careful comparisons and classifications of the types of structure and disease for the object of defining and noting their peculiarities; the archæologist similarly classifies his knowledge of typical forms in the study of pottery or ancient sculpture; the artist and ornamentist do the same in describing the growth of styles; and it is equally important for the architect to make a careful comparison and analysis of plans for different buildings. He will find they will be of service to him in designing buildings for special objects, and in selecting an arrangement that will give the most successful results.

ROYAL SOCIETY OF PAINTERS IN WATER-COLOURS.

MANY old and well-known painters in water-colours are in strong evidence at the Pall Mall Gallery. Studies and sketches by the late Paul J. Naftel, Sir John Gilbert, Sir Oswald Brierly, Tom Lloyd, W. Collingwood, Miss Clara Montalba, Edward F. Brewtnall, W. Callow, George Clausen, R. Thorne Waite, and Mrs. Allingham, are numerous, and a screen is devoted to some very beautiful chalk studies of figures, heads, and drapery, by E. Burne Jones, A.R.A. For the delicate manipulation and freshness of landscape we have little to surpass the late Paul J. Naftel's series of English, Welsh, and Foreign scenery, as "In the Woods, Ponty-y-Caffyn, N. Wales," "On the Wharfe, Yorkshire" (94), and "Sketch in Westmoreland" (104) are all sharp, yet subtle in handling of the brush. The transparent washes of colour, with the high lights of foliage brought out by a half-dry brush and body pigment, are introduced with a charming sense of gradation and breadth. Mrs. Allingham's "Cottage near Pinner" (3), "Old Houses, Hampstead Heath" (198), and her "Spring Time" are delightfully-finished studies of English country life. Her pencil deftly depicts

ivy-clad gables, old brick and tile roofs, flowering creepers and hedgerows, but her minute workmanship is never destructive of repose, or of true feeling. Very widely different is George Clausen's "Idleness" (9), in his broad, sympathetic manner—a girl sitting in a meadow—or his "Cornfield" (101) and "Cloverfield" (165). The movement of mower in the latter, and the light and atmosphere are admirable. Norman Tayler is another close student of country lanes and flocks. The "Timber Waggon" (7) is a clever drawing of horses pulling their load through a swampy depression of the road; the horses are full of movement. In 155 we have also pure colour and breadth of handling. This time Tom Lloyd sends four subjects, all of the rural, quiet sentiment we are accustomed to see, though his style has slightly changed. "In Early Spring" (12) is a charming landscape, a narrow, grass-grown rivulet runs along the foreground, and two lovers are crossing a rustic plank bridge. The flags and rushes, the blossom of the trees skirting the river, and the distant church almost lost in the distant declivity, are painted with tenderness, and in a sympathetic manner. Calm quietude and brightness pervade the scene. Mr. Lloyd's technique, and the combination of sponge and body colour, give a pleasant atmosphere to the distance. No. 28, "Showery Weather," a drove of oxen and sheep, with open meadows and hill beyond, is in this respect, especially in the suggestion of rain, very clever. On the opposite side of gallery is another delicate study of tree-blossom and river (183), in which the handling almost reminds us of the late Mr. Naftel's and Mr. North's works. In the hands of R. Thorne Waite breadth and tone are the qualities which strike us. His "Storm Clouds" has much to remind us of De Wint or Copley Fielding. A small sketch, or "note," "Bad Weather" (32), "The Shoreham Valley" (34), "Cornfield" (153), "October," and "Barley Field" (317), are all subjects suited to his broad handling and decision of touch. Of tranquil lagoons and Venetian studies Miss Clara Montalba gives us several charming examples. The grey and pearly tones are seen in perfection in "The Alps from Cividale" (177), "A Grey Day, Venice" (242), large vessels under sail; and the soft, golden sunsets which suffuse her views of Cividale and Friuli, a Lombard district of Italy, exhibit the range of her palette. No. 96 is full of soft light. A sketch in the same beautiful and fertile region (103) is a delightful piece of suffused golden light—a placid river, with its rocky bank crowned by a church. No. 176, "Sunset," is a splendid study of gorgeous sunset and reflection, a perfect symphony of warm tones. Many other sketches of this lady's recent tour in Italy are exhibited, as in the opaline sea and bright regatta, Venice (6). Matthew Hall's sketch, "Stormy Evening in the Channel" (17), is a strong bit of natural sea colour. C. Napier Hemy has a nice study of "Portsmouth Harbour" (38), and some other sketches of sea and craft, as his "Fish Merchant's Steamer" (296), in a low key of colour. In the same class Sir Oswald W. Brierly sends some admirable "Studies of Boats" (295); a "Design for a Picture," painted for the Prince of Wales, representing the starting the Royal Thames Yacht Club to sail the Queen's Jubilee Yacht Race (244), and some other sketches of Venice, as in Nos. 48 and 146. In fact, Venetian subjects are the rage just now, even by those who have hitherto been contented with English scenery and atmosphere. The canals, lagoons, and piazzas of Venice have a fascination, though the impression of colour is different. Edward F. Brewtnall's "Dragon Cave" is clever and imaginative; and from the same hand we have a variety of subjects. "Near Kynance," with its deep-blue sea and scorched pasture, is one of the best. Mr. Robert Allan is represented in several strong Indian sketches. His "Service in a Sikh Temple," and "A Street in Delhi" (122), are characteristic of his blottesque style and strong sunlight effects. The sketches and studies of Herbert Marshall are numerous. Amongst the best are his "Hyde Park Corner," "Lincoln's Inn Fields," "Old Chelsea" (83), "Winter in London" (144), each and all correct in drawing, and admirably suggestive of those well-known landmarks. We can also admire the architectural study and drawing of Thomas M. Rooke, whose series of sketches from Lisieux display a painstaking tone of detail, as in No. 79, carved doorway and panels; corners and gable ends, Nos. 114, 116. A great contrast is presented between Mr. Rooke's work and William Callow's sketches of Continental cities. One gives studies of detail, the other charming masses of buildings, light and shade, full of poetry. Mr. Callow's work is rather less important than usual in the choice of subjects. His Bruges (222), and "Gorleston Pier," are both excellent. Albert Goodwin is represented by several delicate sketches, full of poetic feeling, of some of our English cities. "Bristol" murky and blue, a night effect, contrasts strangely with Miss Montalba's "November Day, Venice," which is next it. "Wells, from the Market-square" (154), "Rye" (169), "Whitby" (194), "Dordrecht" (285), are charming tinted outline sketches on grey paper with light washes. Samuel J. Hodson has a large picture, "Corner of the 'Ducale,' Venice" (152), besides other Venetian subjects; but we prefer his "Poultry Cross, Salisbury" (92), and his "Close Gate, Salisbury" (196), for effective treatment. Sir John Gilbert, R.A., sends two pictures, "The Squire's Daughter" (90), two ladies on horseback in a forest, being importuned by gipsies, and a bold and cleverly-handled head, "Belinda" (182), full of vigour and grace. George A. Fripp also has several studies of coast scenery, chiefly in Kent and Sussex. "Near Sandwich" (86), and "On a Sussex Common" (355) are sketches in which atmosphere and breadth are conspicuous. Alfred D. Fripp's luminous and delicate sketches on the coast of Dorset (111), and a cornfield with distant glimpse of sea, are full of sunlight. Basil Bradley's large picture, "A Westmoreland Sheep-Washing" (99), is rather cold in tone. The series of studies of figures, heads, and drapery in chalk, by E. Burne Jones, lends an additional interest to this exhibition. Many of these are in coloured crayon. We especially note his four figure studies of Joseph, King Gaspar, Balthazar, and Melchior in the picture "Star of Bethlehem" (123-126). On the screen is a fine study of the Virgin for the same picture, one of those sweet and expressive, yet sad and wistful, faces so often found in this painter's compositions. The figure is clad in a purple cloak and dark-red robe. Another new chalk study of a Head has also a beautifully sweet expression. The studies of drapery are full of grace and refinement. Henry Wallis's Persian lustre vases are fine colour studies of deep turquoise blue. We also see some nice studies by H. Stacy Marks, R.A., Henry Henshall, E. F. Brewtnall (321), G. Lawrence Bulleid, W. Collingwood, Birket Foster (358), &c. One important incident subject is H. G. Glindoni's "Doubtful Customers" (265), a comfortable parlour of an inn, with a party of guests drinking to the toast of some scheme. The costume and accessories belong to the time of Charles I. The landlord and waitress are rather disconcerted at the mirth and equipment of their guests, who carry pistols in their waist-belts. W. Eyre Walker is another contributor of North-country scenery: Nos. 266 and 275 are in nice tone, and we must also notice Frederic Shield's decorative panels of "Daniel" and "Jeremiah" (269) monochrome studies for a series of eight spand having decided claims for their purpose. cannot do justice to other painters of l scape, which preponderates in this gall suffice it to mention some clever and spi sketches by D. Murray, Wilmot Pilsb Edith Martineau, and Charles Gregory.

THE PLUMBERS' COMPANY.

ON Tuesday evening the Master, Mr. W Bishop, the wardens, and court of the C pany of Plumbers entertained the Lord Mayo Sheriffs of London, and a number of gentl interested in technical education and sanit at a dinner given at the Cannon-street H Among those present were Sir James Cri Browne, Mr. G. W. Kekewich, Mr. Thomas, M.P., Sir W. T. Lewis, Professor W Hicks, F.R.S. (Sheffield), Mr. T. Blashil Frederick Abel, F.R.S., Mr. L. L. Dil M.P., Sir Joseph Fayrer, Mr. H. Craik, M Boulnois, M.P., Mr. J. Penn, M.P., M Gripper, Mr. J. F. Beazley, Mr. A. J. I Dr. J. R. Thomson (President British M Association), Mr. Councillor Crawford (C man of the Health Committee, Glasgow) R. C. Driver (President of the Institute of veyors), Dr. R. Thorne-Thorne, Dr. E Richardson, Sir Philip Magnus, Dr. G Poore, Sir T. H. Wood, Mr. J. Wr Connon, F.R.I.B.A., Mr. G. C. Sh A.R.I.B.A., Mr. P. Wilkinson, F.R.I. Mr. MacVicar Anderson, F.R.I.B.A., Mr. Colls, Mr. D. T. Bostel, Mr. W. Braith (Leeds), and others. After the usual toasts, the chairman, in proposing "The H of Parliament," stated that the Plumbers' Com was about to appeal to the Houses of Parliame a Bill to give them disciplinary powers. great object was the protection of the publich by giving the public a means of distingui between competent and incompetent work through a system of national registrati plumbers. Other toasts followed. Earl the day a conference took place at the Guil representatives from Glasgow, Newcastle, pool, Manchester, Birmingham, She Dublin, and other large towns being pr After a discussion, it was resolved, "Tha conference of representatives of educa authorities, master and operative plumbe County Councils and others, is of opinio the technical education of plumbers is a tion of national importance, the provis which is exceptionally difficult and costly that it is expedient that its special clai money help should be brought before the tion of the County Councils, and Municipa porations, and Township Commissioners."

TEMPORARY STRUCTURES.

THE question as to what constitutes a porary structure" within the mean the Metropolitan Building Act, though not one, is likely to be a more frequent ca doubt than hitherto. An application was the other day on the part of the London C Council to raise a question as to this p namely, what is to be considered a "struc erection which cannot be set up witho authority from the Council under 45 Vic. c sec. 13. That provision plainly says that i not be lawful to set up "any wooden struc erection, unless exempt from the op of the first part of the Act, with license in writing," which license ma tain certain conditions as the Counci think expedient; but there is an ex from this enactment in the case of any structure of a movable or temporary cha such as that of a builder's office used duri erection or alteration of a building. The tion arose on a case in which a builder up, at his own residence, a wooden struc iron wheels, to be used as an office, and the purpose of any erection. No doubt th on wheels was intended to be of a per kind that could be shifted about. A su was taken out against him, and the ca heard at Clerkenwell; but the magistra Bros, refused to convict, because he thou case did not come under the meaning section, as the structure was a "b office." The London County Council for a rule for a mandamus to the magis

ase to raise the question, as it was con-hat the magistrate was mistaken in his the exception, it was contended, applied uch structures as were put up tempo-nd during the erection of a building. A was granted.

question sought to be raised by the County Council is important, because of frequent erection of structures of a y character. If Mr. Bros's ruling in g the summons be a correct interpreta-ie section of the Act, any structure on ther than builders' offices might be vith impunity. We should have work-offices, and even shops on wheels or occupying positions in the forecourts and of suburban houses without any power re them. We know there have been to erect wooden structures on wheels for se of offices and shops, but the general of those conversant with the Act has prevent encroachments of this sort. which have been erected have been by the consent of the late Board, but it doubtful whether such consent has rable in the public interests. If a license ly obtained for structures of wood of this n, a large number of persons might avail es of it. We may be sure the County Council would be overwhelmed with applications, and in many of our thoroughfares wooden shops and offices be erected to the great inconvenience of neighbours. It would be difficult to say where it might stop. The precedent is at best a dangerous one, even if strict conditions as to removal were attached to the permission. The definition of "any wooden structure or erection of a movable or temporary character" is somewhat vague, for if the adoption of wheels can make the structure a "movable" one, the meaning of the Act can easily be evaded. The word "movable" appears hardly the term, as it certainly contravenes the better adjective "temporary," which the framers of the Act had mainly in view as the only condition of existence, or exemption under the Act.

NEW BUSINESS PREMISES, BRADFORD AVENUE, RED CROSS STREET, E.C.

THESE business premises, which are now being finished, stand on the site of the old Cripplegate brass-foundry of Messrs. J. Warner and Sons, and consist of eleven warehouses in all, and are being erected from plans by Mr. C. J. C. Pawley, of 2, Prince's Mansions, Victoria-street, Westminster, S.W. The contractor is Mr. Nurse, of Clapham-road, S.W.

ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of the Association was held on Friday evening, the President, Mr. F. T. Baggallay, in the chair. The following new members were elected:—Messrs. W. Furnieux, L. C. Davière, J. Cartledge, G. Newport, P. Dixon, W. Mackinnon, and D. G. Salier. It was announced that Mr. A. Oliver had presented a prize of five guineas for the best sketches and measured drawings of old buildings, to be competed for next session by members of the Class for Sketching and Measuring. The gift was accepted with thanks.

JOHN D. SEDDING: HIS WORK AND INFLUENCE.

A biographical sketch of the late Mr. J. D. Sedding, illustrated with many sketches and designs, and by working drawings of buildings, was read by Mr. H. Wilson, one of his pupils. We gave a portrait of Mr. Sedding in our issue of March 7, 1890. In his introductory remarks, Mr. Wilson satirised the proceedings at art congresses, observing that the passing craze was for an art which was in everybody's mouth but in nobody's heart. With John Sedding this love of art was, however, a reality, as everyone felt who was brought into contact with him, and felt the influence of his rarely gifted and lovable nature. He was born in 1838, at the period of

the great Revival of Gothic architecture and the inception of the pre-Raphaelite movement among painters. While yet young John Sedding fell under the influence of Ruskin. He diligently studied the works of the great poet-critic lent him by Mr. Kegan Paul, and copied the drawings so accurately that Mr. Paul had said he should, in some instances, have scarcely known that they were not the originals. In 1858 Sedding went into the office of Mr. G. E. Street, where his brother Edmund had been trained. The temperaments of the two men were so different—the one autocratic and severe, the other fiery—that they were not likely long to agree. Having formed lasting friendships with William Morris and Norman Shaw, who were then in Street's office, Sedding left in 1863, and entered into partnership with his brother Edmund. He would, however, never hear his old master depreciated, and was loyal to his memory. In Cornwall, where most of his work lay, Sedding's genius found congenial scope. He studied every detail of the little moorland churches, and in his restorations and enlargements of these simple edifices he introduced work which might have been done by the original builders, but for some indications here and there of his own peculiar style. All his additions harmonised thoroughly with the existing buildings and with the surrounding country. This class of work taught him the almost parochial character of English work, and no pains were thought too great to secure a local character and interest for any works, and his after success as a designer was largely due to the extraordinary care and pains he bestowed on these undertakings. In 1868, on the death of his brother Edmund, he took up his practice, and finding little scope in Cornwall, he removed to Bristol, and having but little to do, he spent his leisure time in making designs for embroidery, into which he introduced the most varied subjects in sacred symbols, angels, birds, squirrels, foliage, and flowers, all exquisitely drawn and well adapted to their positions. He worked out a conventionality for himself, and while his flowers, birds, and beasts were unlike those of nature, they had a quaintness, an originality, and an individuality peculiarly their own. Many of these designs were made for the Home of St. Raphael at Bristol, of which he was the precentor. In 1872 he married Miss Rose Tinling, who was of like spirit, and able afterwards to aid him in his designs, and to execute his embroidery. Three years afterwards, in 1875, he removed to London, and opened an office in Great Charlotte-street. For the first few years he had little to do, but sustained by his wife's affection, and his own trustful nature, he was enabled to weather the storm. Mr. Russell, of St. Alban's, Holborn, has given interesting descriptions of the happy home in Great Russell-street, and of his hospitality and kindness to young architects. During those early years of London practice Mr. Sedding worked hard at designs for furniture, embroidery, and gold and silver ornaments, all of which were worked out with great care and much originality. All his work was permeated by his own personality, and while he had studied much of the past, they were saturated with the spirit of the times. Proceeding to describe some of his works in detail, the lecturer observed that one of the most characteristic of the earlier ones was the church of St. Clement, Boscombe, near Bournemouth, built in 1871, a feature of it being the north chapel, fitted with tapestry hangings, furniture, and stained glass, all specially designed by Mr. Sedding. The church was connected by a brick and oak mullioned corridor with the vicarage, the group forming an harmonious whole. Sedding, Mr. Wilson continued, was a man of great vivacity and geniality; but with all this he appeared to possess a sense of presentiment of impending disaster. These times of trial in his earlier London practice made great demands on his strength and endurance. He worked with passionate energy, wrote many lectures and papers, and made designs for the clients who as yet were not; while Mrs. Sedding often worked at her embroidery in the office. By degrees, as his worth and powers began to be recognised, his work increased. In referring to his great influence over others, Mr. Wilson alluded to his impulsive, eager, almost bashful manner in the office, to his winsome ways, and delightful *bonhomie*, adding that his pupils became his personal friends, and the builders and workmen executed, for his sake, much work which was never to be paid for by the client, and no excursion of the Art Workers' Guild was complete without his hilarious presence. His unaffected love of nature was very apparent, and by his carvings and details exhibited great freshness, freedom, and power. The chief gift was, the lecturer thought, that of seeing and of imparting sight to others, and in this he was foremost in his day. In one of his latest works, Holy Trinity Church, Sloane-street, an endeavour was made to meet modern needs in a modern way by means bound down by no requirements of a given style. The church, which had evoked hearthy admiration from Burne-Jones and William Morris, was intended to be a field in which the first workers in each art and craft should unite in doing their best. We should profit little by Sedding's life work if we did not endeavour to carry out his teaching, yet the lecturer thought that the gigantic scheme of education just inaugurated by the Architectural Association would undo much of the work which John Sedding set himself to accomplish. The result of the scheme would be to create a set of dilettanti proprietors of plan factories, and its whole tendency was to perpetuate the Academical system of training. The scheme was certainly an admirable system of preparation for passing the Institute examination, if that were a goal worth aiming at. On the contrary, he held that the Royal Academy and the Institute had done much to impede the progress of architectural art. What was wanted was the abolition of the architect employed and the revival of the artist workman. The practice of the noblest of the arts was at present being degraded into a mere money-making business office. The designer ought to erect his own buildings; he should get rid of his office and set up a shop, and not a studio. As to pupils, as Goethe had said, the best of all preparation for a workman was to take part of the work of his master. He would advocate that the master designer should take a series of shops where the work could be prepared, for the truest education for the artist was that of working at his craft. He would predict that the Association scheme would end in ignominious failure, and architectural education would simply mean filling the brains of youths with useless book learning. It would be better that the self-styled practical man of business should restrict himself to laying the drains he loved so well. The late John Sedding made himself a workman, and regarded no trouble as too great to take to ascertain the points in the trade; he used the workmen's fingers as his own, and the men felt the reflex influence of his enthusiasm. The men in the employ of a firm at Ilmington who executed much of his work, were fast forming an art school. The fact that one man had such influence showed that others could do it if they would, and then we should see a national art and a national craft. Mr. Sedding wore himself out by his exertions, and died unexpectedly, after a short illness, while on a visit to Winsford vicarage, and his devoted wife, who went down to nurse him, followed him after a few days.

Mr. Leonard Stokes, ex-president, in proposing a vote of thanks to the lecturer, expressed his admiration of Sedding, whom he had known as a friend, and referred to his church of St. Clement, at Bournemouth, as the best in a town where nearly all the R.A. architects had built churches, while the church of the Holy Trinity, Chelsea, was of the greatest interest. He regretted that Mr. Wilson had seen fit to attack the Association scheme; Sedding himself, although opposed to the Institute system at one time, changed his views latterly. Neither the Institute nor the Association should be blamed for recognising the existing state of things in the profession and endeavouring to improve them, even though they recognised that in points they were wrong.

Mr. E. W. Mountford seconded the motion, remarking that Mr. Wilson was wrong in provoking a discussion on the committee's methods with such a subject. He referred to the enthusiasm and geniality Mr. Sedding displayed during the Association excursions, and in alluding to his works said it was as puzzling as interesting to ascertain what his style really was.

Mr. C. H. Brodie and Mr. D. J. Blow deprecated Mr. Wilson's attacks on the Association's new scheme of education, while Mr. Owen Fleming suggested that Mr. Wilson's enthusiasm could be most usefully employed, not in criticising the Association's method, but in practically aiding the work at the Marlbor street studio. It was to be regretted that men whose work they admired were assun lofty superiority to the ordinary practition

The President, in putting the vote of t which was heartily accorded, expressed his that Mr. Wilson should have indulged in a outburst which he felt sure was not inten be uncivil to the committee; it would be helpful if he and other critics would show how to improve their methods of work.

Mr. Wilson in reply expressed his regre had appeared to assume superior airs; felt strongly that if the Association establi studio they would be perpetuating the p bad system of training. The right way set men to work on the buildings themselve he could be of any assistance to the comm he should be happy to aid them. He ha haps, expressed himself too strongly; but necessary to use paradoxes to induce pe think for themselves.

ROYAL INSTITUTE OF BRITI ARCHITECTS.

THE third ordinary meeting of the In for the present session was held on M evening. The president, Mr. J. Ma Anderson, announced that Mr. Wate R.A., his predecessor in the chair, was un be present, owing to the death of his b Mr. Theodore Waterhouse.

SCULPTURE AND SCULPTORS' METHODS IN RE TO ARCHITECTURE.

Three short papers on this subject wer by an architect and two sculptors, Messrs Belcher, W. S. Frith, and T. Stirling Le

Mr. Belcher observed that architectu sculpture appealed to like emotions. Bu might impress the mind of the observe pendently of sculpture; but when tecture and sculpture were combined in one stronger emotions were aroused. He p to make a few practical remarks suggested own observations and experience. The connection existed between the arts of ar ture and sculpture. Every architectura would gain in effect and force if associate sculpture; but how was this association secured? Sculpture had, however, a motive than merely to fill niches. He upon architects that if they could n quantity, they should endeavour to have in their works. Buildings should not be re as a mere groundwork for sculpture; latter should be subordinated to the archi and it was not usually necessary that a tural sculpture should have the finished ch of that intended to be placed in pedimen pure and simple outline was what they Great variations in the plane surface sh avoided, as with the increase of depth relief, there was a large collection and dust in the crevices, and an ad gloom in the effect. In this climate should be to make the most of light, an deepen the shadows. Largeness of scale i tecture could be obtained by the use of sc as the spectator naturally took the huma as the basis from which to estimate dim For this reason care should be taken building should be dwarfed by introducin ture too large in scale. In conclusion, that all should seek to realise that arch sculpture, and painting were but three of one art.

Mr. W. S. Frith dealt with the su how sculpture could and should be under relation to architecture. The question had two sides—that of subject, and that of execution. There was no difficulty in motives, that was subjects, for sculpt difficulty was for the sculptor properly himself of the labours of his predecessors possessed beauty of line and of form was subject for reproduction in sculpture. the fragmentary, or gallery class of sculpture was brought into close relat architecture—the pedestal was subord and conformed to the lines of its statue large work the sculpture conformed to t tecture, which gave it light and shad the sculpture supplied scale, and gener tributed to the effect of the building. not sufficient that sculpture should be be itself: it should be appropriate to its posi

l properly fill its prescribed space. Architecculpture had to be executed to please the eye in a prescribed situation, and the requiren of certain optic laws as to light and shade oreshortening must be observed, and it be remembered that the eye was especially ve in the observance of the vertical plane. ought the affinity of masonry to carving ulpture was, in the present day, somewhat oked. The weaving of the decoration into ucture was the first requirement in archi- sculpture, and next to it were the ons of the scale and of the light hade, the determining factor in which problem being the probable intensity light under which the work would n. On this last point the greatest number takes were made. It was very difficult t this when a building was covered hoardings, and yet the usual stipulation at all the scaffolding should be removed at liest possible moment. The abstract study pture was as necessary for the architecs for the gallery sculptor. When a subis repeated it ceased to interest, and so it the greatest importance that all sculpture be original and varied. There was the realm of nature from which to select subs In going to nature for inspiration, the y to reproduce what is observed directly e repressed; and another fault to be was that of overloading the work tail. Niche and finial figures admitted siderable freedom of treatment within limits. Panels were naturally complete in themselves, and there was a danger sculptor might become so absorbed in tment of his subject as to overlook the n of their relation to and position in the g. Having referred to the use of sculpture ptian art, and its development in Greece, arked that the treatment of the sculptures Parthenon was admirable, for slight as it depth in the metopes, it was so executed k right when seen from below. It was re of the highest class, artistically con- to its position without apparent effort on of the sculptor.

T. Stirling Lee said he looked forward to when there should be no such distinction now existing between architectural and sculptors, but when all would simply be sculptors. When the sculptor received a sion, the first question he asked was what e the probable limit of cost? Having his point, the sculptor next considered the and purpose of the building, so as to n appropriate subject. That selected, ing clearly arranged what it was to tell ld, the sculptor took paper and pencil and carefully the architectural lines and gs by which it would be inclosed, to n the leading lines, scale, and light and Of course, the highest class of subject was hich the human figure was introduced, and ment was the most harmonious that could ued, for there was a continuity of flowing m head to toe throughout the whole nd in every limb, and an unbroken was maintained throughout. The sketch mpleted and made to harmonise with the ural surroundings, a model was made in plaster, so as to estimate the important light and shade. This was governed by wn laws of optics, and it might be disthat it was the relative amount of light and the sculpture, due to their climate and surgs, that gave to the works of each country ar national characteristics. The ques- he amount of shadow cast on the proposed by the surrounding mouldings had to lly considered, as the height and depth of ng had entirely to be governed by these gs. When the model was completed, it ell, if possible, to place it in its ultimate any desired alteration could then be d the sculptor had a complete grasp of . In altar-pieces and reredoses, where icting lights were so very dangerous to t of the work, it was most important model should be tried *in situ*. The work ultimately treated in a plastic or glyptic as a cast or carved work; but he should imself that evening to the latter mode nent. Two classes of laws had to be d in figure subjects: the anatomical and etrical. The lecturer showed a finished rtoon, life-sized, of three draped female and explained how, this being set up alongside, the various planes of stone were carved from it on purely glyptic lines. Considerable skill was needed in selecting the lines of the drapery to be shown. His own plan was to make a small model of the figure from line in the required attitude and position, and then to drape it with Indian muslin, fine flannel being used for drapery where a thicker fabric was to be shown. In the sculptures on St. George's Hall, Liverpool—photographs of which were shown—the perpendicular lines of the adjoining mouldings had to be very carefully kept in view. In the treatment of sculptured drapery no fold should ever be meaningless. In conclusion, he remarked that architectural figure-sculpture ought to have as the qualities aimed at those of solidity, grandeur, dignity, and repose.

In opening the discussion which followed, Mr. George Simmonds remarked that there could be little doubt that the architect, sculptor, and painter had come pretty generally to one conclusion—that any great period of art would be marked by the combination and co-operation of these arts. He believed that sculptors would be found whenever their services were wanted, to meet the awful and serious question of price. It was difficult for a man to give up much of his time and work for the low remuneration that was all that could too often be offered simply for the love of his art; but he believed that among the younger men there would be many who would be willing to devote more attention to architectural sculpture. There were certain effects in the charming cartoon of female figures exhibited by Mr. Stirling Lee which could not possibly be gained in stone. He thoroughly agreed with Mr. Lee that the drapery ought to harmonise with the figure, and that every needless line in its folds should be avoided. It was more easy to decide on the treatment of a sculpture which had to go into a given and definite position in a building, than for a gallery or cabinet subject which might ultimately be seen from any standpoint.

Mr. H. H. Statham thought some of the theories just formed as to Greek sculpture went too far. Architecture had, again, its own effects and poetry quite independently of sculpture. He was rather surprised that sculptors were so willing to give up their independence as to the treatment of pediment statuary, although he quite shared with Mr. Stirling Lee that architecture in panels should have regard to the inclosing mouldings. As to the frieze and metopes of the Parthenon, the sculptures were, he thought, only used decoratively, as they were also in the west front of Wells Cathedral. The Parthenon frieze seemed to him not to have been put in the right place: it is too high up, the relief was too low, and it was insufficiently lighted. He believed that the Greeks themselves did not regard the work so highly as we did, and that if it had to be executed now, a modern architect would have put the sculptures where they would have been better seen.

Mr. William Woodward said it was satisfactory to find that the Institute numbered among its Fellows a gentleman who was prepared to have taught the Greeks how to place the sculptures in the Parthenon. It was still more gratifying to find that so distinguished an architect had not overlooked the arts of the Greeks in his studies.

Mr. William Young exhibited photographs of the carvings that had been executed on the Municipal Buildings at Glasgow. This, the most Republican corporation in the United Kingdom, had cheerfully agreed to the adornment of this group of buildings with sculpture at a cost of £10,000, because he had taken care that with the exception of the substitution of a nobler subject for the principal pediment (which cost in execution an additional £1,500), every sculptured subject and feature was indicated on the original drawings for the buildings.

Mr. Conrad Dressler thought one great difficulty in the direction of progress in sculpture had not been touched upon—the abandonment of the system of apprenticeship. The pupils followed up the work of their masters, and thus, where the method of apprenticeship was still in vogue, we saw continuous progress.

Mr. A. Beresford Pite moved a vote of thanks to the readers of papers, and, in passing, referred with regret to the inappropriate position in which Alfred Stevens's Wellington Monument was placed in St. Paul's Cathedral.

Mr. R. Phene Spiers, in seconding the motion, remarked that at Paris the students for the Grand Prix de Rome, an architect, a sculptor, and a painter in each year, lived together in that city, and thus, when in after-life they were entrusted, as was the case, with important commissions from the Government, they learned to work in co-operation. In the Ecole des Beaux Arts in Paris, the students in all these branches also worked and studied side by side.

Mr. Pomeroy pointed out that the apprenticeship-system had not died out among architectural students.

Mr. W. White, F.S.A., Mr. Stephen Webb, and Mr. Pinker having spoken,

The President put the vote of thanks, which was carried with applause, and briefly acknowledged by each of the three readers of papers.

WAYSIDE NOTES.

AM sorry to see that the old "Red Hall," at Bourn, Lincolnshire, is likely to be de-oyed. Apart from its historical interest as traditional birthplace of the Gunpowder Plot, building is one of the finest remaining speci-ns of red-brick Elizabethan architecture. ie would-be destroyers are the Great Northern ilway Company, who are forming a new line m Bourn to Saxby. The Red Hall stands in way of the railway as planned, and has been sequently doomed to destruction. It is said t a number of influential residents in Lin-nshire have united in petitioning the Com-ny to divert their line, and spare the building; t I rather fear that neither the memory of the e Mr. Guy Fawkes nor the requisition of nty families will induce the directors of a lway company to alter their arrangements for sake of picturesque old architecture or torical associations. My hope is that it may otherwise, for we can ill afford to lose speci-ns of the style of this long-time home of the gby family. And, after all, it is not as if we re in the Russia of years back, and the then r, after his wont, had drawn a ruled line on map from end to end of the proposed rail-y, as a route from which the engineers might erge at their peril.

The inhabitants of the town or village of rington—which may be located by readers sessing a greater fund of geographical infor-tion, and more time for searching maps and ctories, than myself—were reminded, on nday last, of the saying that "Gothic archi-ure never sleeps." A considerable portion he clerestory of the old church of this town village, dedicated to All Saints, and, withal, ed to be beautiful, fell with a crash on to the f of the south-east aisle. A stone in time ld here have saved nine, or more, and timely ration would have done away with the essity for restoration. Not that those having care of the building neglected their duties. ore the disaster, the vicar had contemplated ting his parishioners and the churchmen of district to assist in forming a fund for re-ation purposes, as the church was in many s in a dilapidated condition. Wheresoever rington may be situated, I wish well of any rts to repair the damage of Monday.

---

ortune, in the shape of funds, favours the k of restoration and improvement at Peter-ugh Cathedral. At a recent meeting of the oration committee, Dean Argles offered to five hundred pounds towards the removal of organ to the triforium, and the purchase of a ll organ for use during the reconstruction of greater instrument. Stalls for the choir also accepted from the Freemasons of Eng-, the Corporation of Peterborough, and Mr. s, the chapter clerk; and Mrs. Rigg, hter of the late Archdeacon Davys, has pro-d a new litany-desk.

---

attended the reading of Mr. Wilson's very esting paper on the late John Sedding. It a pleasant and entertaining, while serious instructive, discourse, adding to our store of wledge of the life and ways of the deceased itect. The selection of drawings and hes—Sedding's own handiwork, for the part—added greatly to the value of the r, which was voted excellent. Mr. Wilson's views as to what an architect should be ed generally to go down with the assembled bers of the A.A., although so radical were mendments proposed in the life of the indi-al in question, that some of the recommenda-seemed a little too trying even for the most usiastic. On the whole, however, the prin-s enunciated seemed to be well received, fancied I saw the younger members enough, ing visibly with high architectural enthu-. Well, perhaps they may be allowed to nd drink of such nourishment, for to morrow will face the sterner realities of life, and out why these principles don't work in ice.

. Wilson appears to be a believer in self- and as such was not over-complimentary to ew organisation of the Association. But it sible to believe in the virtue of self-help t the same time appreciate the labours of the who have striven to increase the power of the Association as an educational body. To the blunt assertion that the Association and everything and everyone connected with it was "all wrong," most temperate replies were made, the expressions of more than one speaker in the subsequent discussion being of the tenor of the man of Macedonia in St. Paul's vision—"Come over and help us." And this is the cry of many just now, when men are standing outside the ranks of the architectural societies and bewailing the the times and manners until one cannot blame the public—ignorant of the import of the hair-splitting arguments and failing to comprehend the causes of dispute—if they imagine the architectural world to be one raving Bedlam where every man's hand is against his brother.

In a recent issue, the *St. James's Gazette* says:—"The Oxford undergraduate, on being introduced to Pass Moderations, is invited to decide whether logic is a science or an art, and after puzzling his brains over the conundrum, he is politely informed that it is both." The *St. James's* says "the same solution may be suggested to those gentlemen who seem unable to decide whether they ought to regard architecture as an art or a profession," and incidentally lets us see the rational view of the public with regard to the question in debate when it states "that there is an artistic side to architecture may be admitted even in these days; but when roofs collapse and walls tumble in, we realise the desirability of having architects who know something of building."

A good number of *A.A. Notes* for this month, though stuffed full of the "high-falutin'" Architecture with the big A, and Architect with a still more bloated initial letter confronts us on every page. Mr. Fred M. Simpson has written much good sense for the Association's journal, and one is sorry to find he has been engaged on a wholly illogical article concerning Architecture and Architects, and deprecating the practice of certain branches of professional business, of which, in the same dip of ink, he writes:—"If ignorant about them he may often land himself and his clients in difficulties" (!). Mr. E. P. Warren writes also of Architects, and of that Architecture which "is the first, most necessary, most dominant, and comprehensive of the fine arts; counting as its finest flowers and noblest adornments, the achievements of the painter and sculptor"; while Mr. Reginald Blomfield writes: "The only chance now left for it [*i.e.*, architecture], is that the young men should definitely break with professionalism, and should refuse any longer to prostitute architecture," and brings before our notice the "craftsman architect"; while the whole import of the letter is to decry views in the Address of the President of the Association. In able defence of these, however, Mr. Baggallay writes in the same number, and incidentally makes the sensible remark on the question,—"Architecture—a Profession or an Art?"—that he regards it as one merely of names and definitions, which cannot practically affect the study or practice of architecture, and which is unworthy of the consideration of those who, if they will only give their attention to becoming good architects, can afford to leave it to others to define the nature of their occupation."

What manner of man is the "craftsman architect"? Those who attended last Friday at the Architectural Association may think they know—for the moment, I thought so myself; but, on further reflection, am bound to confess my inability to grasp the meaning of the term. Mr. Wilson spoke of architects teaching each of their pupils some trade or "craft," as the cant phrase goes, but surely this is not all the necessary qualifications for the "craftsman architect." What an assortment of architects we are getting, to be sure! There is our old friend the "artist architect," or "art architect," and—a contemporary production—the "practical architect." Then there is that darling of the public, the "church architect," who used to rank next to the gods; but, since the artist architect came upon the scene, he has had to "take a back seat," as a person who cribs old crockets, copies ancient moulds like a machine, and generally reproduces everything while producing nothing. In the "craftsman architect," however, we have a new friend, though I rather fancy he is only an old friend with a new face—the "artist architect" with a mask on. I trust this new apparition will prove neither a wolf in sheep's clothing, nor an ass in a lion's skin. It has come forward boldly enough to make us suspect the former is the case, while the noise it makes creates suspicions of the latter. Anyhow, I don't think it will eat us all up just yet; but that the good old commonsense architect will continue to plod along as heretofore, making no noise, and *doing all the work*.

Registration is to the front. The Plumbers' Company have felt their feet firmly enough in connection with their most laudable scheme of registration to apply to Parliament for powers similar to those sought by the architectural registrationists, and if the approval of those legislators who were present at the Plumbers' banquet on Tuesday is any index to the mind of Parliament, the company will speedily get what it asks for. The present master of the Plumbers' Company, Mr. W. H. Bishop, is well carrying forward the scheme that was commenced under the régime of Mr. George Shaw, and his wardens are well supporting him. It goes without saying, of course, that the moving spirit all along has been Mr. W. R. E. Coles, the courteous clerk of the company, who must have travelled some thousands of miles, and worked night and day, during the past three years, to make the idea he has so much at heart a success. I fancied, on Tuesday night, a faint expression of regret stole over Mr. MacVicar Anderson's face as he sat at the banquet, that the Fates had not given the Institute another Mr. Coles, and that, after all, the plumbers were going to leave architects far in the rear. Mr. Wreghitt Connon's face, on the contrary, seemed to brighten at the announcement of the proposed application to Parliament. It ought certainly to encourage him in his sensible advocacy of the policy as regards architects that the Institute has had neither the wisdom nor the courage to initiate. Goth.

CHIPS.

Sir John Gilbert, R.A., has presented the whole of his sketches, studies, and drawings to the Royal Academy. They are mounted and bound in volumes, and will be placed on permanent exhibition at the Academy's Rooms, Burlington House.

The contract for the York sewerage scheme was again considered at a special meeting of the corporation of that city held on Wednesday evening. The council were recommended to accept the tender of Mr. Abram Kellett, of Ealing, for the completion of Sewerage contract No. 2, for £75,830 16s. 4d. (the amount of his original tender), subject to the deduction of an amount to be agreed upon between Mr. Kellett and Mr. Mansergh, C.E., in respect of the work executed by Mr. Bottoms. The resolution was adopted.

Mr. W. B. Morgan, the borough surveyor of Weymouth, and late of Southampton, was on Tuesday week the recipient of a testimonial from the mayor, corporation, officials, and other friends, who took advantage of his recent marriage to present him with a gold watch, bearing a suitable inscription.

Mr. Henry James Castle, A.M.Inst.C.E., F.S.I., late Professor of Surveying and Engineering at King's College, London, died at Brighton on Friday last.

The restoration of the Hotel de Ville at Amboise has been completed after ten years' labour, and at a cost to the French Government of £12,000.

The Bishop of Gloucester and Bristol was presented on Monday with a pastoral staff, jewelled mitre, and magnificent cope of diapered gold satin by the laity of Bristol, the presentation being made at the Chapter House by Sir Charles Wathen.

A considerable portion of the clerestory of the parish church of All Saints, Barrington, Cambs., fell on Monday on to the roof of the south aisle. The sacred edifice is in many parts in a dilapidated condition, and efforts were about to be made to organise a restoration fund.

Permission has been granted by the Egyptian Board of Public Works to Mr. Flinders Petrie to excavate this winter at Tel-el-Amarna, and he has left Cairo in order to make preparations for beginning his work.

The foundation-stone of a new school at South Morningside, about to be erected for the St. Cuthberth's and Dean School Board, near Edinburgh, was laid on Saturday. The building will accommodate 603 children, and will cost exclusive of site £8,900. Mr. Robert Wilson, of Edinburgh, is the architect.

Our Illustrations.

LOGGIA OF RAPHAEL, AT THE VATICAN, ROME.

We published the second tier of this magnificent loggia at Rome in our issue for Nov. 9th, 1888, with an account of the decorations and paintings which it contains by the great master and his pupils. To-day we give a photographic view of the lower stage. Sig. Mantovani restored the building a few years ago, and renovated the arabesques and stuccoes, which were originally executed by Giovanni de Udine, from Raphael's cartoons. In the vaults are the series of paintings known as "Raphael's Bible," representing some scenes from the Holy Scriptures. In the painting of these, several of Raphael's principal scholars were engaged. A detailed description of them will be found in J. P. P. Chaffard's "New Description of the Vatican," a work on which he spent sixteen years.

THE WATER-GATE OF HOORN, N. HOLLAND.

The famous Water-gate of Hoorn is the most picturesque building of the most interesting of the dead cities of the Zuyder Zee. Architecturally, Hoorn may be said to be unique, with its many steep-gabled red-brick fronts, beautifully toned with age. The gate is washed by the waters of the Zuyder Zee, to which it presents a circular front, built of a whitish stone, which on the east side and quay front is used but very sparingly in bands, corbels, and voussoirs. The quay front is the most ornate, and is very pleasing in composition, the small staircase turret lending much picturesqueness to the otherwise rather lofty structure. The upper part is corbelled over the lower by the trefoiled corbel table, above which are a small niche and two deeply-recessed windows, with the lower lights shuttered. At the level of the eaves is a rich moulded band of panelling in brick, and in the centre is a semicircular outlook bay over, on which stands a lioness supporting a shield with the coat of arms of the city—a horn. Under the cornice, on a stone strip with scrolled ends, are the two dates 1532 and 1631, the latter the date of alterations and additions, presumably the clock turret, the details of which are quite different from the other work. The jetty front has an octagonal base standing on a sub-base, which on plan is part of a 16-sided figure, giving the opportunity of using beautifully-moulded stops and splays. The form returns to the octagon again in the roof, which has a nicely-shaped bell-cast curve from the eaves. The ornament on this front is confined to the brick corbel table, with many musketry holes and a row of shuttered windows under the eaves. In the centre is another small outlook bay, from which and the adjoining windows many eager eyes must have looked in the time of Spanish troubles, and the defeat of the Spanish admiral, De Bossu, off the coast, when the battle was witnessed by the inhabitants. The stonework of this front abruptly joins the brickwork of the east side, stone bands being continued round to the turret. On the centre the arms of the city are again displayed. The roof is remarkably steep, and is slated with grey scale slating. Above rises the lofty clock turret, with its one-handed clock and peal of bells above, all surmounted by a wrought-iron finial with a hammered-iron ship as a vane. Farther to the east is another water-gate; but it is much less interesting than this one, though not by any means the least significant of the antiquities of Hoorn, which yet bear marked evidence of the past glories and commercial prosperity of the city, the birthplace of Schonten, the ablest mariner of his day, and where the fleet was built with which De Ruyter sailed up the Thames in 1667 and wrecked Sheerness.

Robt. B. Pratt, A.R.I.B.A.

BENTHALL HALL AND MUCH WENLOCK PRIORY, SHROPSHIRE.

These two photographs are from the series taken by Mr. John L. Robinson, A.R.H.A., of Dublin, during the recent excursion of the Architectural Association into Shropshire round about Shrewsbury. We published at the time a full account of the various buildings visited, and we gave several drawings and sketches illustrative of their detail.* Benthall Hall was not then represented, and so we give a view to-day. The chief feature in the house is the long narrow gallery on the first floor, extending along the whole façade, and the three big bays run into it. The square one forming the entry seems to be an addition over the porch soon after the house was erected. Its cornice suggests this to have been the case. The house has some very beautiful works of art in it, and a good oak staircase. Mr. Bateman, an architect and painter, lives in it now; but Mr. Maw resided there some years ago, and put down some tiles which go far to spoil the effect of the fine old hall. The plan of the house is sacrificed very much to the gallery before alluded to.—The Prior's House at Much Wenlock, shown by the lower view, is a delightful old place in a splendid condition, unrestored and well cared for, forming, as it does, part of the country seat of Mr. C. G. Milnes-Gaskell, M.P., who has taken every precaution to prevent damage being done to the building, either by time, visitors, or by restorationists. The arcade leading to the two floors of the building extends the whole length of the elevation, and of late years has been glazed to keep out the weather. It is constructed of a rich red stone, and is delightful in colour, harmonising well with the lichen-covered Broseley tiles of the roof. A plan of the building will be found in the Building News for August 14th last, and in our issue for August 7th a detail drawing was given of the Arcade, now shown by Mr. Robinson's capital photograph in perspective. These camera pictures taken year by year supply a most valued record of one of the most useful annual outings which it is our pleasure to describe as the time comes round.

DUNLOE, WEMYSS BAY, N.B.

This Scotch house on the Clyde has lately been erected from the designs of Messrs. Honeyman and Keppie, architects, of Glasgow, and we give two plans and a view from the garden in our pages to-day. The original part of the building is shown by hatched lines on the plans. Inside, the house has some rich work introduced, with chimneypieces in Gifnock and Corshill stone to the dining-room. The owner is Mr. N. B. Stewart.

FULLER'S COACH FACTORY, BRISTOL.

The history of Messrs. Fuller's works takes us back to the days before George III. was king, when one Walter Wellish applied for and obtained from the Dean and Chapter of Bristol certain lands, situate on what was then known as the Bishop's Park, for the purpose of enlarging a coach factory which was then in existence. In 1815 the business came into the hands of the present firm, Messrs. Fuller and Co., who had their premises on both sides of the road; on the south side are the show-rooms and offices, and on the north side the manufactory, which originally occupied only a portion of the site now being covered by the new buildings, which will provide accommodation for the various departments of the trade, and will, when erected, be one of the largest and best adapted. The contract for the new building is being carried out by Mr. Krauss of Bristol, from the designs, and under the superintendence of Mr. Edward Gabriel (Edmeston and Gabriel). The lower portion of the front is in blue brick, and the whole of the rest in red pressed Cattybrook brick. The stucco-work in the gables is being executed by Mr. Gilbert Seale.

NEW BANK AND OFFICES, GOOLE, YORKS.

This new block of buildings, from the design of Mr. Henry Bell Thorp, architect, of Goole, has been erected for Messrs. Beckett and Company. The offices are intended for commercial use, and for the Navigation Company.

BOYS' SCHOOL, PRIORY ROAD, HASTINGS.

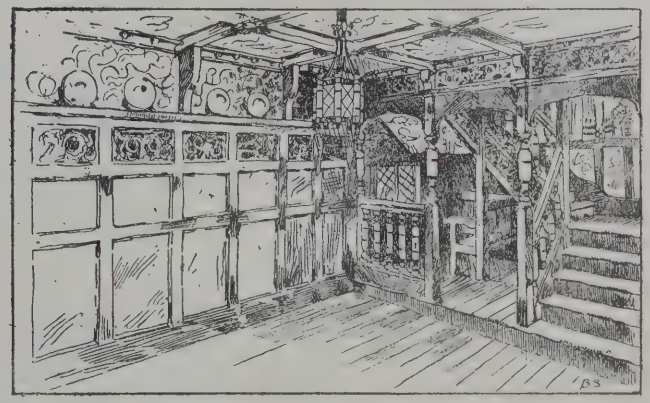
(See description and further illustration, on p. 811).

SCREEN AT THE OLD BARGE INN, NORWICH.

This house, which now bears the sign of the Old Barge Inn, was one of the old city houses, and the site has many associations. The building that originally stood here was called Meddey Inn, from Roger Midday, who purchased it from the Abbot and Canons of Woaburn in the beginning of Edward the Third's reign. William Midday, his son, sold it to William Clere, of Crinsbey, in 1335, and he rebuilt it, made it his city house, and parts of the present house belonged, doubtless, to the 14th century. It passed from William Clere into the hands of the Berfords, the Briggs, then the Elyses, and in 1544 James Marsham, grocer, left it to his wife Cicely, John his son, and his heirs. In 16[illegible] Nicolas Elliot had it, and from him it came into possession of the Cooks, who owned it in the century. It was probably about James Marsham's time that the screen was inserted, and it seems probable that it served as a dividing partition across what was originally the entrance hall, because close to the screen on the right hand from the street is an elaborate Pointed door of Late Decorated or Perpendicular work, which opens to a covered carriage way leading from King-street to the rear of the premises. The house is much altered and multilated; but there are some beautifully groined crypts underneath, probably the oldest portion of the house.

John S. Corder.

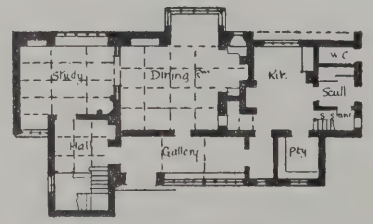
HOUSE NEAR DOUGLAS, ISLE OF MAN.



This house is to be shortly erected near Douglas. The walls to be built of local brick, the roof covered with red tiles, and the half-timber work forming panels visible in the interior as well as exterior of building. The front door to be painted white, with copper hinges, and carving in small panels painted in positive colours. There are five bedrooms and bath-room on the first floor, and an attic in the roof. The nursery has a panelled ceiling carried up into the roof. The estimated cost is £600.

The new recreation hall erected at Port Sunlight for Messrs. Lever Bros., and opened by Mr. Gladstone on Saturday, has been built from designs by Mr. W. Owen, of Warrington, Mr. A. Bleak being the contractor. It is Domestic English in style, and is seated for 750 persons, the dimensions being 80ft. by 50ft.

A woman named Hendra, who was injured by tripping over a fire-plug at Fulham, brought an action for damages against the Chelsea Waterworks Company. It was tried in the Queen's Bench Division on Saturday, when Mr. Justice Smith said the question was whether the plug was reasonably safe for persons passing along the street when placed there. The jury found in the affirmative, and his lordship gave judgment to the defendants.



The memorial stone was laid on Saturday of the Roman Catholic Church, which is being erected at Kirkintilloch. The church is built of red freestone, rock-faced, and is in the form of a long nave, with a clerestory, and north and south aisles. The style is Late Perpendicular. All the internal work is of solid stone, and there are seven massive pillars carrying each arcade. The architect is Mr. Peter Paul Pugin, Westminster, London. The church will cost £5,000.

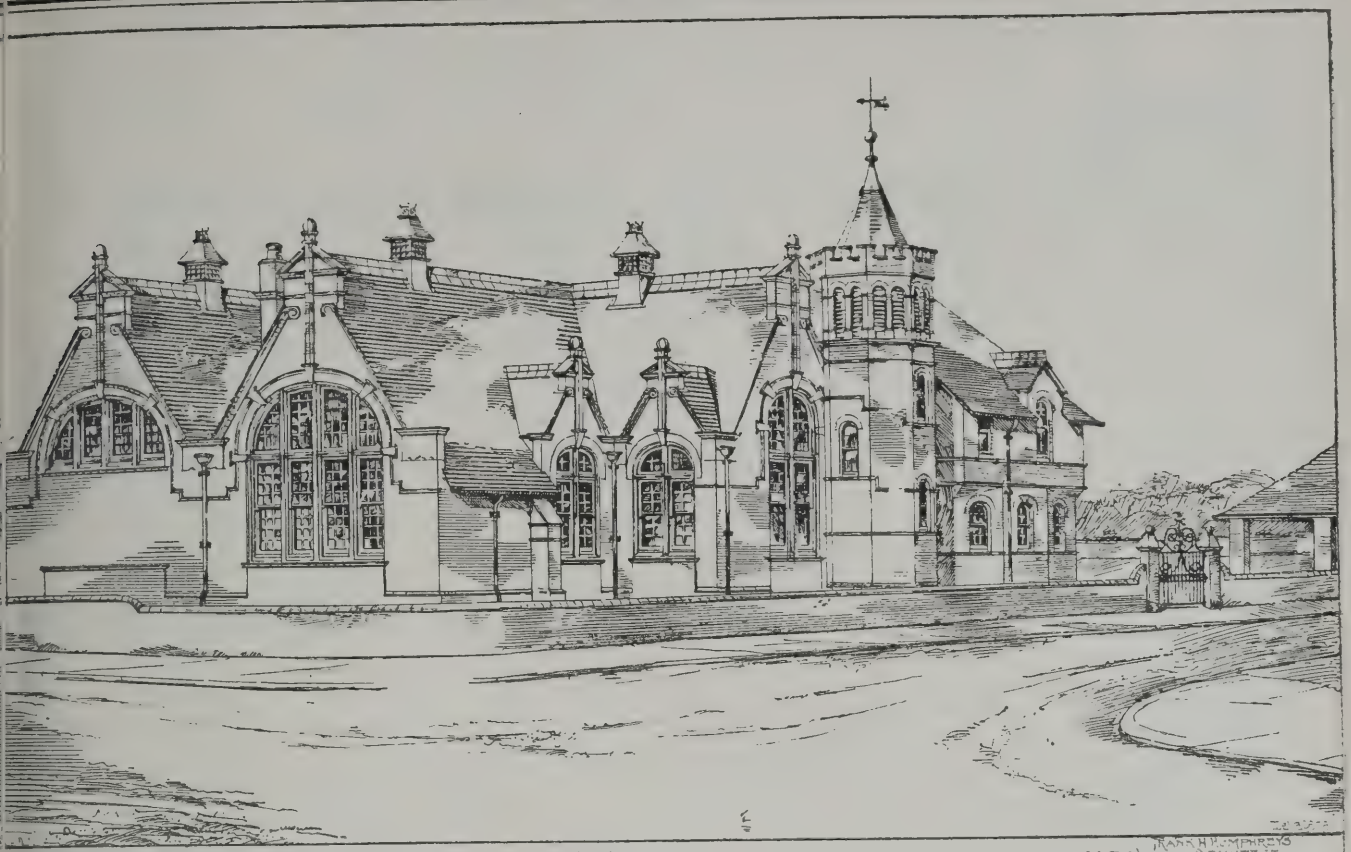
* See Building News, Aug. 7th, 14th, 21st, and 28th, 1891.

INTERIOR SKETCH — HALL & STAIRCASE

PROPOSED HOUSE
DOUGLAS · ISLE OF MAN

GROUND PLAN

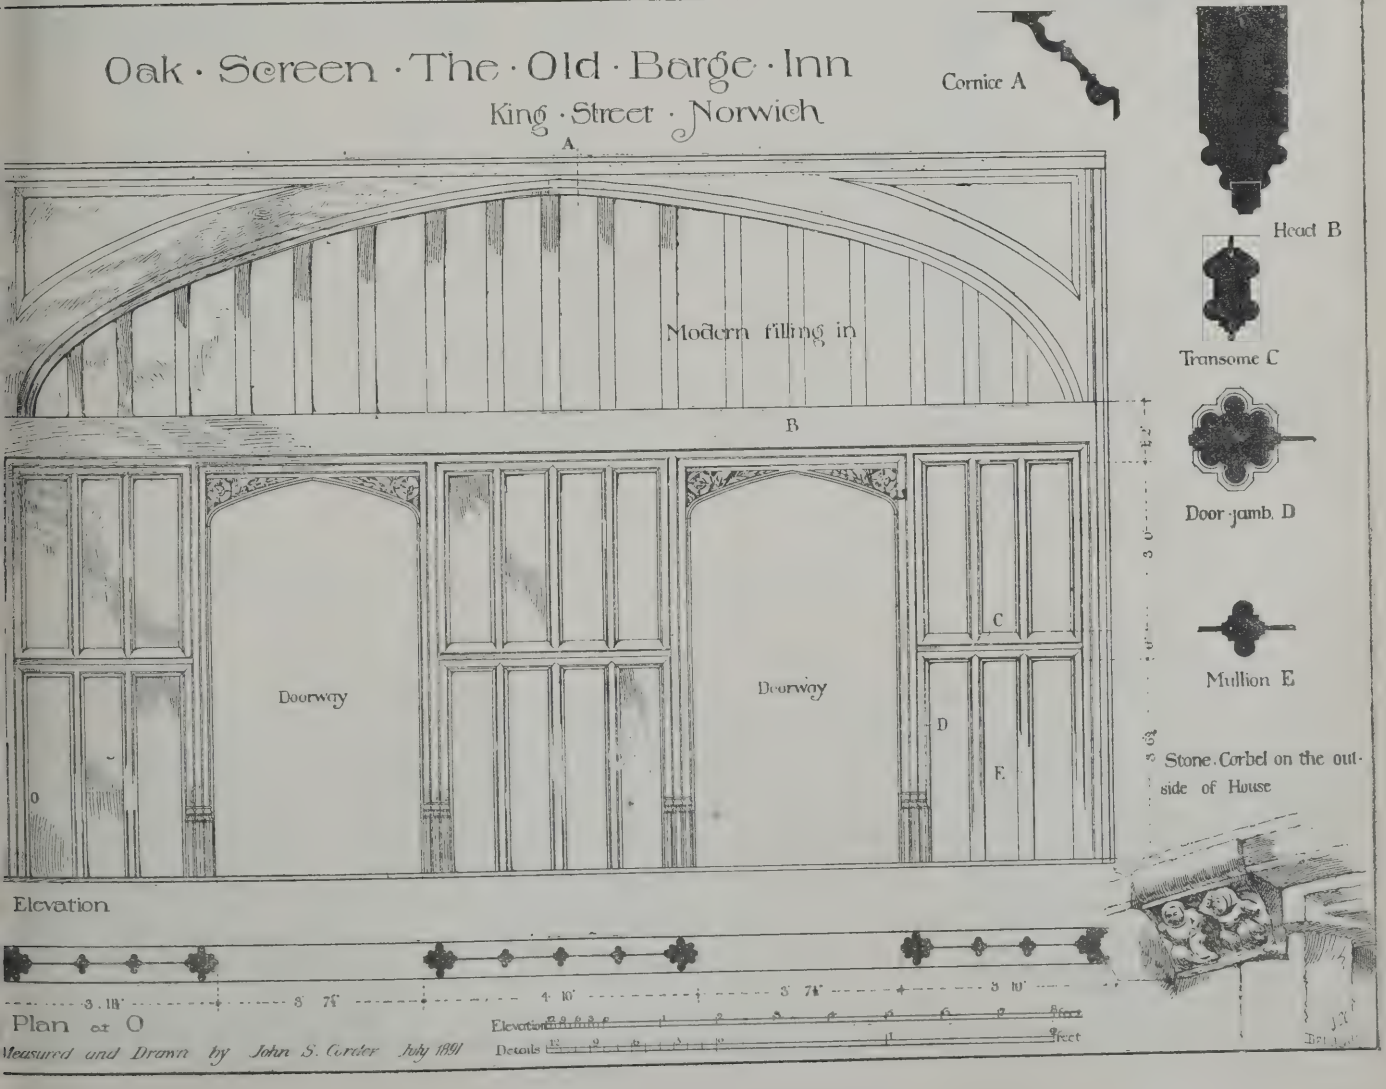
M. H. B. SCOTT.
ARCHITECT



A CARVED CHEST.

THIS carved chest was sold at one of the recent sales, and we made a sketch of it. is not of a very artistic character; but it ked better than it does in the drawing. It s made of oak, and was better designed and structed than ornamented.

It has been necessary to demolish the famous leaning tower of Saragossa, which showed symptoms of ruin, although some thirty years since it had undergone restoration. It was constructed in 1504 as a clock tower, and was upwards of 250ft. in height. The inclination of the tower was so pronounced that its summit overlapped its base by nearly 6ft.



The London County Council, at its meeting on Tuesday, decided, after much discussion, to appoint a Public Health and Housing Committee to carry out the provisions of the Public Health Act (London), 1891, which comes into operation on January 1st next. An assistant medical officer of health is to be forthwith appointed at a salary of £500 a year.

Measured and Drawn by John S. Corder July 1891

SCHOOLS, PRIORY-ROAD, WEST HILL, HASTINGS.

THIS building, consisting of the boys' department of schools for the Hastings School Board U.D., with accommodation for 300 boys, was opened on September 18th last. It is planned on the principle of a central hall, with five classrooms of equal dimension, and accommodating 60 boys each, one being formed by partitioning off a portion of the central hall, which partition can be removed and the size of the hall increased thereby when required for meetings, &c. The other classrooms have glazed sashes in the divisional walls of the central hall; by this arrangement the head-master, teaching in any classroom, is able to overlook all the others. A teachers' room, with a window overlooking the playground, is provided on the first floor. Ample playground accommodation is provided, also a covered play-shed. The whole of the internal joiner's work is slightly stained and varnished. The internal walls are finished in red brick with Bath-stone dressings, and the roof is covered with brindle Broseley tiles. The building has been erected from designs by Mr. Frank H. Humphreys, A.R.I.B.A., architect and surveyor, 6, Trinity-street, Hastings, whose design was selected in a competition limited to local architects. Mr. William Small, of Ore, was the contractor, and the total cost (exclusive of site) was about £3,000.

It has been decided to complete St. Mary's Church, Drogheda, by the erection of a spire, in accordance with designs prepared by the architect of the church, Mr. P. J. Dodd.

PLUMBING REGULATIONS IN NEW YORK.

MANY useful regulations as to pipes are published in New York. It is required that pipes be taken through any roof full calibre, unless smaller than 4in. This is the smallest size that will not freeze up in cold weather in the climate of that city. Caps, cowls, and bends are found of no value, and often increase the danger of freezing. Soil and vent pipes are to extend above main roof, and as far as we can understand the rule, which is not very clear in statement, the distance is not to be less than 30ft. Referring to the falls of pipes, a fall of ¼in. per foot for all soil and waste-pipes is required. No traps are allowed on main vertical soil or waste-pipe. All pipes and traps of the drainage and vent systems are to be ex-

posed if practicable, or covered with woodwork. All waste, soil, and drain-pipes must be tested, and the test recommended is to fill the pipes from front cellar wall to roof with water. The regulation as to connections are that those between lead and iron must be by ferrules. The ferrule should be of the same bore as the iron pipe into which it is to be caulked. The lead should be joined to the ferrule by a wiped joint. Leadwork must have "wiped" joints for all connections. All fixtures must be separately trapped. Other valuable suggestions are given to which we have no space to refer. No doubt can be entertained that there is a vast deal of scamped work done in New York, and a code of rules framed upon scientific principles is absolutely required for the sake of public health. The testing requirements are especially of value, and these should be made under official conditions. The water test is a practical mode of finding out the leaks. Every joint ought to be perfectly dry under the test. Air-pressure is less satisfactory. At the joints a solid oakum foundation for the ring of lead is proposed, and with this kind of joint, if the pipes freeze, the expansion of the ice in the oakum is sufficient to prevent mischief.

BUILDERS' BENEVOLENT INSTITUTION.

ELECTION OF A PENSIONER.

An election of one female pensioner on the funds of this institution was held at the offices, 35, Southampton-row, Bloomsbury-square, on Thursday, 26th ult., Mr. B. E. Nightingale (President) in the chair. There were four candidates for the vacancy.

Shortly after the close of the poll, the secretaries (Messrs. T. Sterling and Ernest Rider) announced the results of the polling to be as follows:—Margaret Alice Richardson, Preston, North Shields, aged 66, widow of T. B. Richardson, late of Bayswater, builder (sixth application), 2,655 votes; Mary Ann Shapland, 132, Stamford-street, Lambeth, aged 71, widow of William Shapland, builder (fifth application), 3,294 votes; Sarah Elizabeth Drake, Tylers' and Bricklayers' Almshouses, King Henry's-walk, Ball's Pond, widow to Francis Drake, late of Acton, builder (second application) 1,339 votes; and Susanna Mansell, of 20, Bridge-road, Hammersmith, aged 68, widow of William Mansell, builder (first application), 806 votes. The successful candidate was therefore declared to be Mary Ann Shapland.

Among the friends of the Institution (others than those already named) who took part in the proceedings were Messrs. Geo. Plucknett, J.P. (hon. treasurer), C. Bussell, J. T. Bolding, W. Scrivener, T. Hall, and H. Ashby.

Votes of thanks to the chairman and scrutineers closed the proceedings.

ARCHÆOLOGICAL DISCOVERIES AT SOLIHULL.

At the Midland Institute, on Friday night, before the Birmingham Archæological Society, Mr. J. A. Cossins read a paper, amply illustrated with drawings, photographs, and lantern views, describing some discoveries of considerable interest which he has lately made at Solihull. They relate to the history of the Solihull Hall, a moated and half-timbered manorial residence of the 14th century. The place consists of a great hall in one story, and a transverse building of two stories which contains on the upper floor a large room, with an open roof and a dormitory, and on the ground floor two rooms, which were probably the kitchen and the buttery. The building has been converted into a comparatively modern dwelling-house, and is occupied. Additions have been made to it, and its internal features masked; but Mr. Cossins has been able to make a complete drawing showing its ancient appearance. The hall is covered by a roof carried by three fine arched principals of different designs. The entrance was by a porch into a passage crossing the hall at the south-west end, and divided off from it by a screen. At a height of seven feet this passage was floored over, forming an open gallery which served for the minstrels when great feasts and festivals were going on, or for the ladies, from which to view the proceeding going on below. At the opposite end of the passage is another doorway, which led into the courtyard; and from the passage also there were doors which led to the buttery and the kitchen. In most halls of any great importance there was at the opposite end a platform or dais raised one or more steps above the floor, on which was the high table for the lord and his principal guests. But this was not usual in the moderate and small-sized halls, and here there is no trace of it discernible. Beyond the north-east end of the hall Mr. Cossins thinks there was another building, containing possibly the cellar, and possibly some other of the offices. The interior of the hall, and especially the open-timbered roof, is wonderfully like that of Baggilly Hall, in Cheshire, with the exception that in the latter the timbers are cut into trefoils and quatrefoils. The lower portion of the walls has been rebuilt in later times with brickwork; but Mr. Cossins is pretty certain that there were no windows except in the usual place—namely, above the horizontal plate of oak which runs round the hall at a considerable height, where, indeed, he has traced them. Above the plate the walls were built alternately with vertical timbers and wattled spaces of equal width. These walls have served to keep out wet and cold very effectually for more than four hundred years, though their thickness is but 3¼in. There is not a crack in the plaster nor the thinnest space between the plaster and the wood. The timbers of the roof are all chamfered and held together by pegs, there being, probably, no single piece of iron in all the framework. Windows of this period were seldom glazed, except in very important houses, and the openings were closed with shutters. There would be a brazier in the middle of the apartment, the smoke escaping through a lowered turret in the roof; and, indeed, the timbers just above are blackened and covered with soot. The floor was probably nothing but well-rammed earth, which was the custom in middle-class houses. In the two-storied portion the principal room is the "solar," a feature of the halls of this century, but lacking when, a century earlier, the king or the lord slept with his retainers of both sexes in the hall. It was the private sitting-room and bedroom of the lord. The solar has an enormously massive roof of a remarkable character, of which the central beam in the middle truss is 24in. deep and 8in. or 9in. thick. Of the moat only two sides remain, but the position of the parts filled up can be traced. Who built the hall is quite uncertain. Dugdale speaks of the Barons Limesie, of Ulverlei (Solihull), and of their estates passing to the family of the De Odinsells, and Mr. Cossins thinks it possible that Solihull Hall may have been the chief seat of the barony.

CHIPS.

On Thursday in last week Col. John Ord Hasted, R.E., held an inquiry at the town hall, Ryde, into the application of the corporation to borrow £2,707 for works of street improvement. The application was referred to favourably by the inspector.

The University Chapel at King's College, Aberdeen, was reopened for service on Sunday after undergoing improvements and restoration at a cost of £3,000, the work, which is not yet completed, having been executed from the designs of Dr. Rowand Anderson, of Edinburgh.

Sir W. Anson, Warden of All Souls', Oxford, laid the memorial stone of the new Oxford House at Bethnal-green on Monday. The house is of red brick. It has been designed by Sir A. Blomfield, and will cost £13,000, of which nearly £10,000 has been subscribed. Upon the ground floor will be a library and club and dining-rooms. The second floor will be planned as bed and sitting-rooms for the residents, while upon the third floor will be a chapel.

Houdon's model, in coloured plaster, of his "Voltaire Assis," which the sculptor gave to his friend, François Dumont, has been bought for the Louvre.

The Dean of St. David's has found, within the precincts of the cathedral, a sepulchral slab of considerable historic interest. It bears a beautiful cross, ornamented with interlaced work, and a Latin inscription in minuscules, which reads: "The two sons of Bishop Abraham, Hed and Isac, lie here peacefully." Bishop Abraham was killed by the Danes in their last descent upon St. David's in A.D. 1078.

A carved oak altar table has just been placed in Sledmere Church, the gift of Sir Tatton Sykes. It is Early English in style, and has, as chief subject of the panels, "The Adoration of the Blessed Virgin." Mr. J. T. Beckham, of Low Ousegate, York, was the sculptor.

Building Intelligence.

Bournemouth. — The new Congregational Church, Richmond Hill, was opened on Tuesday week. The church is built on the site of the old one, which was too small to meet the requirements of the day. The main building takes the form of a cruciform plan, without any endeavour on the part of the architects to follow ecclesiastical precedents. The aisles are simple gangways except at a time of emergency. The floor is raised towards the south, and the seats are arranged on a circular plan. In the nave and transepts on the ground floor accommodation is provided for about 900 persons, but the number will be increased to 1,100, by sittings to be provided in the end and transept galleries. The building, which is fitted with the electric light, is designed throughout in the spirit of a Late period of Gothic. The materials used in the construction have been Swanage stone, facing with Bath and Portland stone dressings. Messrs. Lawson and Donkin, of Bournemouth, are the architects, and the builder is Mr. E. H. Kingerlee, of Oxford. The total cost has been about £12,000. We illustrated the church in our issue of Dec. 13, 1889.

Bristol.—The new wing of Bristol University College, the head-quarters of the Bristol Medical School, will be completed by June next. The present building represents the first section of the future grand front of the completed design. The building, which will accommodate 150 students, is Tudor in style. The museum will be on the ground floor, and the library over it on the first floor. They will both be 50ft. by 30ft., and will be lighted by four large traceried windows. The remainder of the wing includes a tutors' room, preparation room, students' room, and faculty room on the ground floor; and a physiological laboratory and theatre on the first floor. In the basement are living rooms for the caretaker, and heating chamber and store-rooms. The total cost will be £6,000. The architects are Messrs. Jones and Bond, of Corn-street, and the builder is Mr. G. Humphreys, Stapleton-road, Bristol.

Budleigh Salterton.—The foundation-stone of St. Peter, Budleigh Salterton, was laid by Miss Mary Rolle on Tuesday, Nov. 24. The church is being built by the Hon. Mark Rolle from designs of Mr. Geo. H. Fellowes Prynne, F.R.I.B.A., the builders being Messrs. Luscombe, of Exeter. The design is of Early type, having a nave of five bays, 28ft. wide, 40ft. high and 89ft. in length; and a chancel, 24ft. broad by 40ft. high by 36ft. long; north and south lean-to aisles, a double transept on south side forming the nave to a small apsidal chapel. Organ galleries and vestries are placed on the north side of chancel; a tower and spire, rising to the height of 140ft., is placed at the north-west angle of building. The chief entrances are at the west end and through south porch. Other doors are, however, provided to transepts and aisles. The whole of the exterior and interior facings will be in wrought Devon limestone or marble. Exterior dressings will be in Box Ground stone, weatherings and plinths in Doulting stone. The interior dressings will be in Beer stone, polished Devonshire marble being used in the columns and many of the smaller details of work. The cost of the present work will be between £7,000 and £8,000, the tower and spire being left out for the present.

Felton, Herefordshire.—The parish church was reopened on Nov. 26 after restoration from plans prepared by Mr. T. Nicholson, F.R.I.B.A., of Hereford, and carried out by Messrs. Beaven and Hodges, also of Hereford. An organ-chamber has been added. The chancel has been rearranged; it is fitted up with new oak stalls, having fronts enriched by open quatrefoil tracery, a stone credence has been inserted in the north wall, the Caen stone reredos has been raised so as to admit of a constructional shelf of dark Devonshire marble at its base, and the central niche has been surmounted by a crocketed canopy, also of stone. The floor within the altar-rails has been relaid, partly in marble mosaics, and partly with Messrs. Godwin's encaustic tiles. The walls in the interior of the chancel and nave have been ornamented with coloured designs supplied by the Rev. Ernest Geldart, rector of Little Braxted, Essex. Externally the work of restoration has included the strengthening of the foundations where settlements had taken place in the walls. The

rch has been rebuilt, and windows opened t of the sides. Larger buttresses have been ected against the angles of the tower and nave. pon the tower a short spire-like roof, covered ith oak shingle, has been erected. The west indow has been rebuilt, and filled with stained ass, by Messrs. Heaton, Butler, and Bayne. he cost of the restoration has been £750.

Llantillio Pertholey.—The reopening ser- ces of St. Teilo Church, Llantillio Pertholey, ear Abergavenny, were held on the 24th ult. he nave and porch roofs have been newly ated, the tower restored, a new oak block floor ut in the nave and south aisle, and a tile floor in ne chancel. The nave walls and windows have een restored. New oak seats have been placed the choir, and the reredos is also of oak. A ulpit has been constructed of the carved-oak anelling which lined the walls, and a vestry as been formed by placing screens across two ays of the passage leading to one of the chapels. n oak chancel-screen has been executed by Mr. William Yeo, of Green-street, Cardiff, from the esigns, and under the superintendence, of the rchitects. All the high pews have been swept way, and chairs provided instead. The work as cost about £900. Messrs. Kempson and owler, Llandaff, are the architects, and the uilder is Mr. J. G. Thomas, of Abergavenny.

West Kirby.—The second portion of St. ndrew's Church, built at a cost of £3,500, was onsecrated on Saturday. The section at present rected comprises the nave, 24ft. wide, with north nd south aisles, and a temporary chancel. An rgan has been erected at the end of the south isle. The entrances to the nave are by north nd south porches. The nave and aisles are rovided with chairs, accommodating 400 wor- hippers. The building is in the Early Perpen- licular style; it is erected in local red stone, and he interior of the walls is faced in ashlar of the ame material. The roofs are open-timbered in itchpine, with hammer-beam principals sup- orted by moulded shafts rising from the capitals f the arcade columns. A clerestory surmounts he arcade. The temporary east wall has been reated with simple decoration on the upper portion, and dossal hangings above the altar, which has a richly-worked frontal. Mr. W. H. Forde, of Birkenhead, is the general contractor for the work, which has been carried out under he superintendence of the architects, Messrs. Douglas and Fordham, of Chester.

COMPETITIONS.

Glasgow Art and Music Gallery.—The period for sending in sketch-designs for the new art and music galleries at Kelvingrove, Glasgow, in connection with the preliminary competition, expired on Tuesday. A large number of sketches have been sent in, and from these Mr. Alfred Waterhouse, R.A., who will act as assessor, will select six, and these architects will subsequently furnish new plans for a final competition.

West Hartlepool School Board.—In the recent school competition, West Hartlepool, Mr. William Landless, the architect to the Leeds School Board, who was appointed assessor, has made his award. He has selected three designs from out of the number sent, and is of opinion that the design marked No. 1, by Mr. J. Mitchell Bottomley, architect, 18, Albert-road, Middlesbrough, should have first place; design marked No. 5, by Messrs. Mawson and Hudson, architects, Bradford, the second place; and design marked No. 7, by Mr. J. Garry, architect, West Hartlepool, the third place. Mr. Landless says: "The designs by Mr. J. Mitchell Bottomley are distinguished by careful study, and a thorough knowledge of the requirements of a school, and are marked by a scholarly regard for the importance of the undertaking. The designs by Messrs. Mawson and Hudson do not bear evidence of the same skill, and the lighting has not received such care as its importance demands. The designs of Mr. J. Garry have been very hurriedly got up, and whilst the plan has certainly the merit of simplicity, the author has not given the necessary attention to the lighting, and it is to be regretted he did not give more time and consideration to the subject, as such would have resulted with advantage to himself. In conclusion, allow me to say it has been a pleasure to go into this question for you, and I have no hesitation in stating that Mr. J. Mitchell Bottomley has fairly won the competition."

ARCHÆOLOGICAL.

The Saxon Crypt in Ripon Cathedral.—During the past two days, with the permission of the Dean and Chapter, several members of the Royal Society of Antiquarians have been pursuing researches in the Cathedral, Ripon, with a view of clearing up one or two doubtful points about the old Saxon crypt under the central tower. The gentlemen present were the Rev. J. T. Fowler. F.S.A. (Durham), Mr. J. T. Micklethwaite, F.S.A. (London)—by the latter of whom the investigation was organised—Mr. J. W. Walker (Wakefield), Mr. C. H. Reed (British Museum), and Mr. T. M. Fallow (Coatham). The Saxon crypt is approached by steps from the south-east corner of the nave, the crypt being directly in front of the choir-screen. The present entrance is not original, stairs being still traced in the north-east corner of the crypt. It has always been thought that a corresponding set of stairs existed at the south-east corner of the crypt, and it was also surmised that that part of the cathedral had been used as a place of burial. It was to investigate these questions that the excavations had been made. Generally speaking, it has been found that there have been no alterations at the south-east corner of the crypt; and that the plan as now laid down—with the exception of the western entrance—is that of the original crypt of the 7th century. No trace of steps could be found at the south-east corner; but the visitors noticed, about 2ft. below the level of the nave, the remains of the floor. In the course of the excavations, two curious deposits of bones were found, but no indication of a place of burial. One of these deposits of bones was discovered many years ago. The other deposit was similarly placed, but was previously unknown. The latter appeared to be mostly of human bones, but mixed with some animal bones. The first-named deposit has been put back as found, with a lead plate and inscription recording the two openings. The other deposit has been placed in a four-gallon jar in the situation in which it was found, with a similar leaden plate. Full details of the excavations were taken by Mr. Micklethwaite, who wrote upon the subject some years ago.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Glasgow Philosophical Society. — At a meeting of the Architectural Section of this society, held on Monday evening, Mr. John M'Math, Master of Works to the School Board of Glasgow, read a paper on "Progress in School Building since 1873," in the course of which he stated that eighteen years ago there were 228 schools in Glasgow, giving accommodation for 57,290 scholars, while now there were only 126 schools, but with accommodation for 92,181 children. In 1873 there were 33 schools that were unsatisfactory on account of accommodation or teaching, or both, and now they had only one school in that position. Mr. M'Math afterwards entered into the subjects of school planning, lighting, furniture, heating, and ventilating, and concluded with a description of a model school.

Mr. W. N. Inman, surveyor and valuer, of 126, Maida Vale, corner of Greville-place, W., has been elected a Fellow of the Surveyors' Institute.

Parliamentary powers are to be sought next session for the removal of one of the city churches in Bristol—that of St. Bartholomew in Union-street, the site of which Messrs. J. S. Fry and Sons desire to secure for the extension of their business premises. The proceeds of the sale, should the Bill be passed, will be applied for erecting a church on St. Andrew's Estate, Montpelier, where the unfinished works of a church begun several years since, and abandoned, are crumbling to decay.

The corner stone of a mission church at Yeoford Junction was laid on Friday. The building will seat over a hundred people, and will be a very cheap one, the estimated cost being £220 only. It is to be built with hollow brick wall and slated roofs, ornamented with pierced red ridges. A small porch is placed at the western end. The vestry is on the north-east side, with sexton's tool-house adjoining. A turret with oak shingled spirelet is placed above the apex of the nave roof to contain the bells. The entrance doorways are of English oak, with moulded heads of Polyphant stone. The moulded window-sills will be of the same material. The windows are framed of fir, with moulded mullions, transome, and heads. The floors will be deal boarded on oak joints. Mr. W. J. Dart, of Crediton, who prepared the designs, is the builder.

Engineering Notes.

Manchester Ship Canal.—The sub-committee, appointed on Oct. 9 to examine the reports and estimates supplied to the Manchester Ship Canal Board, in their report state that they have carefully examined the estimates, and have accepted that of the company's engineer (Mr. E. Leader Williams), confirmed by the corporation engineer. The revised estimate under consideration showed an increase of £863,595 over the company's engineer's estimate of January 1, which amounted £3,228,695, and of £512,614 over that of the corporation engineer of February 28, which amounted to £3,579,676. The company's engineer suggested means of saving £36,000, and, deducting this sum, the increase over the estimate of the corporation engineer is reduced to £476,614. The committee point out the reasons for the increase, and go on to recommend that all work not essential to the opening of the canal for traffic should be postponed to the extent of £363,000. They are of opinion that the canal may be opened in the spring of 1893. They further calculate that if the whole available assets are absorbed, there will be an eventual surplus of £1,400,000. This report is signed by three of the directors; but the other two, the representatives of the Manchester corporation, have declined to sign it, and present a report of their own, in which they state that it is with considerable surprise that they have been presented with an amended estimate in excess of that presented in February to the council. They think that the available resources can only be adequate by the adoption of immediate and vigorous retrenchment. They have arrived at the conclusion that the resources of the company are not so economically administered as they ought to be, and to this end they strongly urge:—(1) That portions of the work be let to independent contractors; (2) that the workshops should be reorganised, and public tenders invited for materials and stores; (3) that the present salary of the official staff should be carefully revised, and all superfluous service dispensed with; (4) that other extraneous charges should be still further curtailed. Further, they deem it to be necessary that a committee should be forthwith appointed by the board to carry out the suggestions contained in these observations.

CHIPS.

The death is announced, at the age of 51, of Mr. Thomas Angelo Moore, architect, of Sunderland. He was the son of the late Mr. Thomas Moore, architect, of the same town, and enjoyed a large practice, principally in the district.

Mr. Robert Mathers, J.P., of Lurgan, for the past twenty years proprietor of the steam sawmills at Lurgan, died suddenly last week. He was a town commissioner for 26 years, but resigned office about two years ago.

The Belgian art critic and archæologist, M. Jean Rousseau, who was secretary to the Commission Royale des Monuments, died last week in Brussels, aged 62.

A new elementary school at Skirlenbeck, near Pocklington, was opened last week. It has been built from plans by Mr. C. H. Channon, architect, of Malton.

The council of the Royal Society of Painter-Etchers will follow up the Rembrandt and Turner collections of 1890 and 1891, by including in the society's forthcoming exhibition in March next, a selection of the etchings of Vandyck.

New Sunday schools attached to Dewsbury-road Wesleyan Chapel, Leeds, were opened on Friday. They have cost £3,200, and have been built from designs by Mr. G. F. Danby, of Leeds, the architect of the adjoining chapel.

A portrait of Sir William Thomson, P.R.S., was formally presented to Glasgow University on Nov. 26, the unveiling being performed by Mr. Balfour as Lord Rector. The portrait is a three-quarter length by Professor Herkomer, R.A. Sir William is shown seated in an arm-chair, wearing a black silk gown, with purple hood, with the hands clasped in front.

At a meeting held at the County Hall, Aylesbury, on Saturday, it was decided to establish a county museum for Buckinghamshire. Sir Harry Verney, who suggested the scheme, promised to hand over his collections when the museum was formed, and Dr. Walford, of Leighton Buzzard, also intimated his intention of presenting Anglo-Saxon relics to the institution. A committee was formed, who will endeavour to raise £3,000.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—S. G. and Co.—B. of S.—C. B.—H. N.—J. M.

OUR NEW YEAR'S DOUBLE NUMBER.

EARLY application for space for advertisements in the NEW YEAR'S DOUBLE NUMBER, which will be published Jan. 1, 1892, is advised. The space at our disposal is very limited, and we cannot guarantee insertion of any advertisement that may reach us later than Dec. 15.

"BUILDING NEWS" DESIGNING CLUB.

SMILASH THE GOTH. (You need not show a model's room. The north faces the front, as stated. Cement facing to walls, and stone dressings to openings, as stipulated.)—OLD GOLD. (House detached, but presumed to be one of a row of similar houses on various-sized plots. See last answer.)—S. P. B. (Lights on three sides only.)—JOHN THONEY. (Rough-cast face is not asked for.)—Several other correspondents are answered by the above replies.

DRAWINGS RECEIVED.—"Q. E. F.," "An Old Hand," "Dividers in a Circle," "Flute," "Persevere," "Plan," "Ilex," "Magnet," "Red Brick," "Black and White Shield," "Devil's Chimney," "Mica," "Symbol," "Filiolus," "Ivanhoe," "Smiash the Goth," "Terracotta," "X. S. X.," "East Anglia," "Punch," "Gyp," "Sniktaw," "Nodrah," "The Idler," "The Useless One," "Jean," "Hilarious," "Pen," "Black Prince," "Sparrow," "Lacrosse," "Hardwick," "Orient," "Peterborough," "Albyn," "Airedale," "Hales," "Johnny Jones," "Leo," "Streona," "Wit," "Pendragon," "Ich Dien," "San Juan," "Graham," "Westward-ho," "Hut," "Herbert," "Thrift," "Whasp," "Gobo," "Sunset," "McGinty," "Leontes," "Compass Box." "T" in a circle, "Boreas," "Tempus Fugit," "Baluster," "Love's Labour—?" "Koko," "Jackey," "Ayrshire."

Correspondence.

FLOOR CONSTRUCTION.

To the Editor of the BUILDING NEWS.

SIR,—A few weeks since I saw that you had allowed attention to be drawn to the absurdity of continuing the term "folding" in connection with floors, when "folding" has been so long discontinued.

May I ask your kindness in allowing me to allude to another term in connection with floors, which should be discarded for the same reason? I mean the word "fillistered." When I started at the bench, between forty and fifty years since, floor-boards were very rarely, if ever, thicknessed (machinery was not then available for either sawing or working). In lieu of this, however, they were "fillistered"—*i.e.*, a sinking was worked by a side fillister plane on the backs of boards down to a gauge-line which had been run along each edge. Before nailing the boards, after they had been fitted to their places, they were turned face downwards, and the surface which would bear on the joists was adzed down to the fillistered sinkings; or, if the board would not carry the gauge-line all through, it was packed up. Many who probably never engaged in this may have seen old floors which were thus treated.

Certain books which are regarded as authorities treat "rebated joints" and "fillistered" as synonymous terms. In reality, they are as different as square-edged and match-jointed would be: in one case the board retains its width, in the other it does not.—I am, &c.,

SURVEYOR.

ROGERS v. JAMES.

SIR,—Referring to this case as reported, and also from the letter in your issue of the 27th Nov. the judgment appears to be one of the most extraordinary ever come to by a judge and jury.

First, the plaintiff is mulcted in half his charges; and, secondly, the defendant is allowed a counter-claim to a large extent, for what he had already been paid in the settlement of accounts; he appears to have wished to get his house for half the original cost. Where does the liability of an architect end? Is he to pay for the houses as well as lose his commission, whenever an unprincipled client chooses to make the claim?

In the interests of the profession it would appear to be the duty of the R.I.B.A., as the representative body, to take this case up and carry it to the highest tribunal, if they ever do take any such matters up.—I am, &c.,

T. R. W.

[Ah—If!—ED. "B. N."]

Intercommunication.

QUESTIONS.

[10669.]—**Kilns for Bending Sheet Glass.**—Where can I see kilns, heated by gas, for bending sheet and plate glass? Why do not makers of such apparatus advertise in the BUILDING NEWS?—A CONSTANT READER.

[10670.]—**Contagious and Infectious Diseases Hospital.**—Information as to the best book published on the planning and construction of above hospitals will be esteemed a favour.—SANITARY.

[10671.]—**Red Pine.**—"W. S.," in answer to "Woodenhead," says red pine (P. rubra) is sometimes called by botanists P. resinosa, and that pitch pine (P. resinosa) is sometimes called by botanists (as Laslett) P. rigida. But, to make the confusion worse, Stevenson (a good authority), in his book, "The Trees of Commerce," says pitch pine is the P. Australis of Michaux (whom "W. S." quotes as an authority), and that American red pine is the P. resinosa of our botanists. How can we truly identify the woods called by the botanical names P. rubra, P. resinosa, P. rigida, P. Australis; common names, American red pine, Canadian red pine, pitch pine;—and how many different varieties do all these names represent?—SAPPY.

[10672.]—**Salisbury Cathedral.**—Can any authority on the above inform me if the vaulting of the nave and aisles is constructed of stone. I know that the ribs are of stone, and, if I remember well, the vaulting is striped with red lines, which makes me inclined to believe they are of chalk, lined in to imitate stone blocks. The cloisters, I find, have chalk vaulting, with stone transverse and diagonal ribs, therefore it is probable that the nave and aisles are similar. The remarkably slender Purbeck shafts of the Lady chapel (I refer to the single ones) seem very weak to be able to carry the superincumbent weight of stone vaulting, and as the vaulting in this part of the cathedral is covered with coloured decoration, it is impossible for anyone to tell, looking up from the floor, whether or not it is of stone. The stonework of the stupendous spire, according to some authorities, is only 7in. in thickness. Can anyone connected with the restoration inform me as to how the horizontal beds of the stones are jointed?—DAVID F. SMITH, Maidstone.

[10673.]—**Evening Classes.**—Can any of your readers say whether any private evening classes are held in London, where building construction and drawing are taught? If so, perhaps they will name them in full.—CESTRIA.

[10674.]—**Wood-Block Floor.**—Would someone who has had experience in such matters kindly suggest the best remedy to be adopted in the following case? In an ancient, massive, stone and flint-built building, recently restored, the wood-block floor, which is laid upon 6in. of good Portland cement concrete taken 2in. into the walls, was, after the late heavy rains, covered with water. The building is in a low situation, and the floor is below the level of the water in the surrounding ground when the springs are high, but cannot be raise —H.

[10675.]—**Laying-out and Drainage of Buri Grounds.**—I should be much obliged if any of yo readers would let me know if there is any small work this subject—or in what work is such subject embodie GOTTSACKER.

REPLIES.

[10663.]—**Timber.**—"Woodenhead" is correct applying to the terminology of timber the epithe "miserable" and "confusing," of which he gives i stances emanating from sources which are consider standards of education. "Woodenhead" will find t subject of red pine correctly treated in my recently pu lished timber trade handbook, "The Trees of Commerce (London: W. Rider and Son). Now as to Hurst's han book. It says, "Red pine (P. rubra):"—this should re (P. resinosa)—"a mere variety of the (P. sylvestris Scotch fir." It is no such thing: it is a distinct specia Again, "Its grain is finer than the P. sylvestris." T truth is the reverse, except where the latter is grown the south fringe of the great pine belt of Northe Europe—i.e., in the north of Prussia, and shipped fro Memel and Dantzig. In fineness of grain it is imme surably inferior to the shipments of red or yellow fir fro St. Petersburg and the White Sea. Again, "It contain less sap." This is not true in fact, for if trees of equ diameter were taken, the balance would, in my opinio incline to the European fir. Again, "It is very free fro knots." This, in comparison, is questionable; the writ was evidently only acquainted with the butt cuttings se here in the squared log, a class of wood which, owing the cost of transit, is shipped of prime quality. Th American pine, when cut into planks and deals, and shipped to this country, is, in comparison on the detail knots, inferior to the European fir, for it has the draw back of having its knots black or rotten, in place of re hard, bright, or live knots. Hurst's handbook, claiming, on behalf of the Canadian red pine, "thes very desirable qualities," over the European fir, advance a claim that is unfounded. The red pine is a soft, mil undurable wood, of no special value in the trade. very closely resembles in colour and texture the wood the European fir, and is often wrought into joinery wor as this wood. Red pine is wholly unfit for outdoor work or for engineering purposes; its place is indoors, for pur poses to which the ordinary Canadian white or yello pine (p. strobus) is applied. It is a curious fact that, storing American sawn-pine deals or planks, they wi not admit, owing to their perishable nature, of bein placed together, whereas those of the European fir ma be piled away without laths or strips, in which case litt or no damage will ensue from decay. Laslett, in hi "Timber and Timber Trees," is correct in his botanica classification of the red pine, his remark about it being called "the Norway pine in New England, but being different from the tree so called in Europe, which a kind of spruce," needs some explanation. "Norwa pine," in Europe, is an obselete term for the Norwa spruce (Abies excelsa), a wood used for masts, spars ladders, and scaffolding. The Norway spruce grown in England is often called the spruce fir. The commercia names of wood are older than the botanical names, an have never been corrected to conform with science,—henc we have the following anomalies:—

The Pinus sylvestris, producing the Scotch or Baltic fir.			
,, Abies excelsa,	,,	,,	Norway or ,, spruce.
,, Picea pectinata,	,,	,,	Swiss pine or silver fir.
,, Pinus Australis,	,,	,,	,, pitch pine, &c.

That the Norway fir was an old term for the present Norway spruce seems evident by reference to Milton's description of Satan in his first book of "Paradise Lost":—

> "His spear, to equal which the tallest pine,
> Hewn on Norwegian hills, to be the mast
> Of some great admiral, were but a wand."

Laslett speaks favourably of the red pine, but he does not do so to the disparagement of the Baltic fir, as reference to his table of experiments proves. My published notes, however, drawn from this source, are as follows:—"Compared with Dantzic red fir, the breaking weight of the red pine is 25 per cent. less, its tensile strength is 16 per cent. less, and its crushing weight, on 2in. cubes, is 33 per cent. less."—W. STEVENSON, Queen's Dock, Hull, Nov. 23, 1891.

[10665.]—**Diseases of Animals in Relation to Meat Supply.**—The best information on this subject for candidates preparing for the Sanitary Institute Examination for Inspectors of Nuisances is that given by Dr. Francis Vacher in his pamphlet on "Diseased Meat." This is now, however, out of print in pamphlet form, but is reprinted in the "Sanitary Record" Diary. I shall be glad to give "C. L. H." or others desirous of information further particulars on application.—C. C. S.

[10667.]—**Swimming Baths.**—As one who has had a lot of experience in the same, I should by all means use wrought iron, it being much more suitable for the large span required than either wood or wood and iron combined. The design, of course, must depend on the cost; and if properly painted when new, the corrosion need not be feared at all. For example see all the newest baths in any of our large towns, or refer to back numbers of the BUILDING NEWS.—T. W. HUDSON.

The bust of Mr. Andrew Carnegie, which was executed to the order of the corporation of Edinburgh by Mr. M'Bride, sculptor, was on Monday placed in the Edinburgh Public Library.

The appointment of engineer to the municipal commissioners of George Town, Penang, Strait Settlements, has been conferred upon Mr. Robert Peirce, Assoc.M.Inst.C.E., M.S.E. Mr. Peirce was articled to the late Mr. R. Vawser, of Manchester, but for several years he has been resident engineer for the Birmingham corporation upon the construction of cable tramways, and for the past three years has been assistant to Messrs. Pritchard and Co., of London and Birmingham.

Legal.

ARCHITECTS' AUTHORITY.—V.

When an architect acting as agent for the owner exceeds his authority, whether general or special, expressed or implied, his employer or principal is, of course, not bound by his actions. If an architect orders work to be done which is beyond the scope of his authority as such agent, and, unless he expressly accepts that work, or ratifies the action of the architect, or adopts it in the final certificate, the employer cannot be made liable to the builder. Attempts have been made to render the owner liable in such cases, because he has entered into possession of the buildings upon which such work had been executed without authority. But these have failed, and it is clear that the mere possession of property upon which unauthorised work has been done cannot make the owner liable to the builder for the cost of such work. As to what will amount to a ratification of work done by an architect in excess of his authority, this is more a question of fact than of law, and the evidence forthcoming will in such case have to be weighed upon its merits. In dealing with corporations and local bodies, whose contracts always require to be under seal, builders should be very careful, because in such cases excess of authority by an architect cannot be made up for by mere implication, and nothing can be recovered for work done extra or outside the sealed contract.

If an employer stands by while he knows his architect is exceeding his authority in ordering work from a stranger, and lets this man expend money for his benefit without interfering, then certainly that employer will not be allowed afterwards to set up as a defence the want of authority in his architect. Of course, as long as the architect keeps within the scope of his authority, he is in no way liable to the builder, because he is simply acting solely acting as the agent of his principal, the owner or employer of them both. It is part of the arrangement that the work done by the architect and the builder is for the benefit of the owner only; and there is thus no sort of contract whatever that the architect will pay the builder for any work he orders, acting within the limits of that authority. Still, if an architect, like any other agent, leads the builder to suppose he is really the principal, then he would become personally responsible. Another noteworthy point is that, speaking generally, an architect cannot legally delegate his authority. He is, indeed, a personal agent, and he is not empowered to authorise an agent to act for him in regard to his special agency as architect of a building-owner.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

LOCAL BOARD.—"STREET."—I am obliged to my correspondent for his letter. But I am quite aware of the clauses of the Public Health Act to which he is good enough to refer me, and of the numerous cases as to the meaning of the word "street." In the question I answered, the private road was not a "street," and, as a fact, the Local Board have now so decided for themselves.

F. M. G.—SURVEYORS' BY-LAWS.—He could do so unless he agreed not to practise privately; but this would be subject to the regulations of the Local Board.

L. B.—FREEHOLD PAVING.—The local charge for paving and making the new road is legally a charge on the property, and as you are now the owner, you are liable to pay the same. You should have seen to this before completing the purchase.

T. H. C.—BUILDING CONTRACT.—The works formed one under and one contract, and if you are not allowed to go on with the job, you have a claim for damages.

QUANTITY SURVEYOR.—CHARGES.—The architect only who employed you is permanently liable, as he does not appear to have been authorised to do so by his client.

The Queen has conferred a knighthood upon Mr. George Reid, who was recently elected President of the Royal Scottish Academy of Painting, Sculpture, and Architecture, in succession to the late Sir W. Fettes Douglas.

The War Office authorities have accepted the tender of Messrs. Reed, Blight, and Co., Limited, of Plymouth, for the erection of a new block of married soldiers' quarters at Fishers Nose, Plymouth. The work will be commenced forthwith.

LEGAL INTELLIGENCE.

AN ARCHITECT CONVICTED OF ARSON.—The trial of Arthur Muckleston Leach, 38, architect and surveyor, and Henry Cove, 27, coffee-house keeper, indicted for maliciously setting fire to a dwelling-house known as The Rocks, in the occupation of Leach, at Bedfont, near Staines, with an intent to defraud the Liverpool and London and Globe Insurance Company, took place before Mr. Justice Hawkins on Friday, Saturday, and Monday. Both prisoners were found guilty, and were sentenced to six years' penal servitude.

RE PAINE BROTHERS.—The debtors were builders, carrying on business at Stamford-hill, and Mr. Willis appeared on their behalf at the London Bankruptcy Court on Friday, for the approval of a scheme of arrangement which had been agreed to by the creditors. The accounts showed gross liabilities of £39,096, of which, however, only £5,219 was unsecured, and the assets were estimated at £5,188. The scheme provided for the vesting of the property in a trustee, also for the completion of certain unfinished buildings, and for the postponement of a large family claim until the other creditors shall have received 7s. 6d. in the pound. The application was opposed by the Official Receiver mainly on the grounds that the debtors had brought on their failure by rash and hazardous speculations, and that there was not sufficient evidence that the assets would realise 7s. 6d. in the pound. The Registrar refused to approve the scheme.

IN RE HARWOOD AND FOULGER.—A meeting of the creditors of Harwood and Foulger, builders, of Upper Seymour-street, Leeds-road, Bradford, was held on Wednesday week. The gross liabilities were stated to be £849 14s. 5d., and the assets £95 8s. In August, 1889, up to which time the debtors had both been journeymen joiners, they took over the business of joiners and builders which had been conducted by Messrs. Dinsdale and Shepherd, paying £107 for the goodwill and stock. For this firm and for other persons they have since executed several contracts, upon the whole of which they made a profit beyond working expenses and maintenance. The debtors ascribe their difficulties to unfortunate speculations in land and houses.

FRONTAGE LINES.—At Hampstead, on Wednesday week, David Cross, builder, St. Mary's-villas, Harlesden, was summoned by the London County Council for having erected a building beyond the general line of frontage in Burrard-road, without the consent in writing of the London County Council. Burrard-road formed part of the Woodbine Estate, West Hampstead, which, in 1877, was laid out and disposed of as a building estate, with roads formed and sewers laid. In February, 1891, the defendant commenced digging the foundations of a house and shop at the corner of Burrard-road and Fortune Green-lane, the entrance to the shop being at the angle at the corner of these roads, with a private entrance in Burrard-road. In April, 1891, the superintending architect of the London County Council defined the general line of frontage for buildings in Burrard-road, and in his certificate described the house now in question as being "situate in Burrard-road," but to be "numbered" as in Fortune Green-lane. On May 4 the district surveyor called attention to the fact that the house projected 10ft. beyond the line of frontage in Burrard-road; but it was not until October 28 that the summons was taken out. On these facts Mr. Biron, for the Council, asked the Bench to make an order for the demolition of the projecting side of the house, which was roofed in and practically ready for occupation. Mr. Macmorran, for the defendant, contended that the summons must be dismissed, as the prosecution was not instituted within six months from the date when the building was begun. Furthermore, the case was affected by the House of Lords' decision in "Barlow v. the Vestry of St. Mary Abbot's, Kensington." The Bench dismissed the summons, because the proceedings were not taken within the prescribed time, and also because they held that the building was in Fortune Green-lane, and not in Burrard-road, and they allowed the defendant five guineas costs against the Council. Mr. Biron intimated his intention to ask the Bench to state a case.

T. POTTER AND SON, LIMITED, IN LIQUIDATION.—In consequence of arrangements being made for one or two of the shareholders of this business to carry on same as a private firm, a special resolution was passed on the 10th ult. for the voluntary winding up of the above company, and Mr. H. S. Potter and Mr. H. A. Potter have been appointed joint liquidators for the purpose of such winding up.

WANTED, AN OWNER FOR A CHURCH.—At Worship-street, last week, the Rev. E. F. Coke, vicar of St. James's the Great, Bethnal-green, attended in answer to a summons taken out by the London County Council, directed to "the owner of the Red Church," for disobeying a notice to take down the brick and stonework of the spire, the pinnacles of the spire, the gables, and other parts of the structure, to make the same secure. Mr. Coke said that he was not the owner, and it was difficult to say who was. The church was one of those dealt with on the terms of the Act introduced by Sir Robert Peel, and was not a parish church or a district church. Bethnal-green churches were under a local Act which conferred very large powers, but this particular church was said not to be within that Act. Mr. Bushby made an order "on the owner" to do the work specified.

EMPLOYERS' LIABILITY AND SUB-CONTRACTS.—Mr. Commissioner Kerr and a jury had before them on Friday in the City of London Court a claim under the Employers' Liability Act, which was made by Charles Hunt, labourer, to recover £234 as damages for serious injuries he had sustained through the negligence of a foreman in the service of the defendants, Messrs. John Mowlem and Co., contractors. The plaintiff said that he was employed by the defendants in bricklaying work in enlarging Liverpool-street Station. A quantity of bricks fell upon him, and he was seriously hurt. The defendants, while regretting the accident, set up a sub-contract between themselves and one Bills, who, they alleged, employed the plaintiff. This, it was urged, exempted them from liability. The plaintiff said he only regarded Bills as a foreman. The jury found for the plaintiff for £175.

THE BELLAGIO ESTATE (LIMITED).—A meeting of creditors of this company was held on Nov. 26 at the office of the Board of Trade. This company was registered in August, 1887, with a nominal capital of £40,070, and was formed for the purpose of acquiring and developing certain freehold land at Lingfield, Surrey. The amount of the purchase-money agreed upon was £45,000, the failure of the company being attributed to the want of sufficient capital to proceed with the development of the estate. The liabilities to creditors amount to £111,817, of which £51,007 are expected to rank, and there appear to be no available assets. Considerable discussion took place with reference to the appointment of a liquidator, and the meeting was adjourned for a week, when a trustee and committee of inspection were appointed.

IN RE THOMAS ROBERTS.—A meeting of the creditors of Thomas Roberts, contractor, has been held at St. Helen's, Lancs. Mr. G. J. Critchley, plumber and painter, was voted to the chair. Mr. Cook, solicitor, presented a statement of accounts, which showed liabilities £5,469; assets, £3,013. It was finally resolved to ask Roberts to present his own petition. He commenced business about twelve years since, and has had a good many important contracts in and around St. Helen's. Last year he tendered for the new gas-tank which the corporation are erecting in Knowsley-road. During the progress of excavation (Mr. Roberts says) he came upon 10ft. of rock which he was not aware of, and by which he lost very considerably. He also says he has lost upon other contracts, and he has been harassed with labour disputes. The corporation gas-tank is being completed under the direction of Mr. S. Glover, gas engineer to the corporation.

RECOMPENSE FOR REJECTED TENDER.—In the Queen's Bench Division, last week, before Mr. Justice Wills and a jury, the case of Dickinson v. the Debenture Corporation was heard. The plaintiff, Mr. George Dickinson, is a contractor for public works, carrying on business at Loughborough Junction. In July, 1890, he saw an advertisement inviting tenders for the construction of a marine drive at Douglas in the Isle of Man. The plaintiff put in a tender for £4,595. The tender was not accepted; but by its means the plaintiff was brought into contact with the defendant corporation. Long discussion took place, and a new scheme was prepared, and the plaintiff was invited by the directors to get ready a tender for the work. He worked day and night on it, and gave a tender for £7,700. Mr. Floyd, the engineer for the corporation, said: "The Board practically gives you the tender; but to make it legal, other tenders will be invited." He attended a board meeting, and agreed to take £200 off his tender to have the matter settled at once. He was asked, "When can you begin?" and said, "At once;" and he sent his brother to the Isle of Man to begin the work on the following day. He was surprised to receive a formal letter stating that the contract had been given to someone else. He wrote claiming some recompense for the trouble to which he had been put, and, failing to get any satisfaction, he commenced this action. Cross-examined, the witness said he had agreed to pay Mr. Floyd, the engineer, 2 per cent. on the amount of the quantities if he got the contract. Mr. Germaine (defendant's counsel): That is a usual payment. His Lordship: I am not at all sure that it is a usual payment. I have a very strong opinion about matters of this kind. Mr. Charles Dickinson, the brother of the plaintiff, said he went to the Isle of Man, upon his brother's instructions, to make the preliminary arrangements for carrying out the contract.—During an adjournment, counsel had a consultation with the judge, the result of which was that the case was settled by defendants paying the plaintiff £100 and costs.

RE W. H. TURNER.—The debtor was described

as an architect and surveyor, of 58, Finsbury-pavement, and his accounts showed debts of £874 10s. 6d., and assets £24 1s. He now attended before Mr. Registrar Linklater for public examination, and stated, in reply to Mr. Wildy, official receiver, that he was proprietor of the De Beauvoir Arms, Kingsland, in July, 1885, and he afterwards sold the house at a profit of about £300. In April, 1888, he set up as an architect and surveyor, having offices in Finsbury-pavement. He had between £200 and £300 capital at the time. In this business he became acquainted with a builder, to whom he advanced about £200, but the sum was not repaid, and he now considered that he had lost the money. He attributed his failure partly to this cause, to ill-health, and other causes. The examination was concluded.

Surveyor's Certificates.—Elmes v. Burgh Market Company.—This action was tried before Mr. Justice Vaughan Williams at the last Lincoln Assizes, and came on at Queen's Bench last week for further consideration. The action was brought by a contractor for money alleged to be due to him under a contract made with the directors of the Burgh Market Company for the making and completion of a cattle-market at Lincoln. It was contended at the trial by the defendant's counsel that no proper certificate had been given by the surveyor to satisfy the terms of the contract. In his judgement delivered at Nottingham, Mr. Justice Vaughan Williams remarked :—This is an action brought by a contractor for the balance of money alleged to be due to him for works executed by him for the defendants. The first defence raised is that, under the contract, a certificate from the surveyor appointed under the contract is a condition precedent to the plaintiff's right of action, and that no such certificate has been obtained. The plaintiff relies upon a certificate dated the 22nd of November, 1890, which is in the following terms: —"Works at Burgh Market, Spilsby, 22nd November, 1890, J. W. Thimbleby, Esq. I, the undersigned, do certify that Thomas Elmes is entitled to receive the sum of £127 in payment of final instalment of contract after maintenance of the above-named works. £127.—(Signed) J. B. Butcher, Architect." Two objections are taken by the defendants to this certificate—first, it is said that it is not such a certificate as is required by the contract, that the whole of the works were in a complete and satisfactory state; and, secondly, it is said, that the person who gave the certificate was not at the time of giving it surveyor within the meaning of the contract. The first objection is on the authority of "Morgan v. Birnie," and a good objection, for the document seems to be a mere statement of account, and not the required certificate. I further think it doubtful whether the person giving the certificate continued to be the surveyor for the purpose of certifying after his discharge, which occurred before the 22nd of November. But neither of these points is of much importance, because the plaintiff also relies on the oral certificate of Mr. Butcher given to the chairman of the defendant company and to the directors; and I find that this certificate was, in fact, given; and it was the giving of this oral certificate which really led to the dismissal of Mr. Butcher from his post of surveyor. I also hold that the certificate required by the third clause of the contract is not a certificate in writing; and I find that the plaintiff did, in fact, complete the whole of the works to the satisfaction of the surveyor. Under these circumstances, I give judgment for the plaintiff for the amount claimed with costs.—After the delivery of this judgment, the defendant's counsel applied that the consideration of the case might be further reserved in order to enable the defendant to call certain witnesses, whose evidence had not been taken at the trial, to contradict the statement of the surveyor that he had given a verbal certificate of the satisfactory condition of the works to the secretary of the defendant company. The case was accordingly further adjourned to London, and that evidence was given, and the Judge now confirmed his prior judgment, saying that he saw no reason to alter it.

In re W. Bulcock, Liverpool.—Before Judge Collier in the Liverpool County Court, on the 20th ult., William Bulcock, who formerly carried on business as a builder at Sandringham-road, Tuebrook, again made application for his discharge. Mr. Ring, the deputy official receiver, stated that the judge had adjourned the hearing for 12 months, which had now expired. Bankrupt had erected property which he valued at £39,587, but regarded at the time of his receiving order as unsaleable. Upon the property in question there was raised by way of mortgage £35,942. The only asset realised was one of £5, and no dividend was paid. His Honour commented on the fact that Mr. Bulcock had not kept proper books, and made an order further suspending the discharge for six months.

The statue of Edward Irving, who was born in Butts-street, Annan, has just been completed by Mr. J. W. Dods, of Dumfries, in the clay. The statue is to be erected in the town of Annan.

Our Office Table.

Rather late in the day Mr. G. Shaw-Lefevre has awakened to the fact that a hideous addition in the meanest brickwork is being added to King's College, in destruction to the architectural effect of the river frontage of Somerset House. The right hon. gentleman asks in the *Times* why some steps are not being taken, by way of injunction or otherwise, to stop the progress of such an unsightly excrescence? Mr. Alfred Waterhouse, R.A., follows up this protest in the same journal, pointing out that Somerset House, being a symmetrical composition, its lines cannot be altered without destroying its charm. "If," he adds, "as is the practice in Paris, the designs of all structures likely to interfere with our public buildings and our principal street views had to be submitted, before their erection, to some body of experts fit to pass a wise and unprejudiced judgment on them, some most regrettable blunders would doubtless be avoided." Messrs Stephen Salter and Adams, the "architects" of this extraordinary addition to King's College, in a curt rejoinder, assure Mr. Waterhouse that there is no intention whatever of carrying the building still higher, and for this we suppose the admirers of Chambers's masterpiece will be duly grateful. Mr. Lewis Angell, who is, like Mr. Salter, a F.R.I.B.A., pleads that no body of men ought to be expected, by the rules of business or logic, to subordinate their interests to sentiment. King's College is, he says, very poor, and it requires more accommodation. So much for Fellows' appreciation of architecture as an "art."

Mr. W. B. Richmond is, says the London correspondent of the *Manchester Guardian*, throwing himself heart and soul into the decorative work which he is doing for the choir of St. Paul's Cathedral. He has erected a special studio for the purpose in the garden of his residence at Hammersmith, and there spends the greater part of his working day. All who have seen the first designs, prepared in water colour, agree that they are among the best work that the artist has done, and their beauty is not less than their appropriateness to their future position. From water colour the designs will be transferred to mosaic; and Mr. Richmond's great knowledge of the technique of this part of the work will here stand him in good stead. The style in which the artist has worked is broad and flowing, and the colour, "rich but not gaudy," is sufficiently powerful to be effective in the high spandrels where the mosaics will ultimately be placed.

The total number of Private Bills to be introduced into Parliament next year is only 188, and the total number of Provisional Orders that will be applied for is but 69. Of the total number of Private Bills, 81 relate to railways, docks, and canals; 33 to gas, water, and electric lighting undertakings; 21 are Corporation and Local Board Improvement Bills; 11 relate to tramways; and the remainder are of a miscellaneous character. Twenty-four of the Private Bills relate directly to London, among which are two rival schemes for railways from Waterloo to the City, a line from Waterloo to Baker-street, and another projected line from Charing Cross to St. Pancras and Hampstead. The existing or authorised electrical railway companies are also promoting extensions from King William-street to Islington, and from the Royal Exchange to Liverpool-street; whilst other lines are proposed from Finsbury Park Station to the City; and from the City to Epping Forest. The London County Council are responsible for four Bills—namely, their General Powers Bill, a Bill for the construction by them of tramways over Westminster Bridge to Charing Cross, a Bill for the construction of subways for the reception of gas, water, and other pipes, and a Bill dealing with the London water supply, the expense of promoting which will, in the event of failure, be paid by the Corporation of London. Of the Provisional Orders, 30 relate to electric lighting, 16 to gas and water companies, 13 to piers and harbours, and 10 to tramways.

Commenting on the annual meeting of Messrs. Robert Boyle and Son last week, *Money* says: "The majority of the shareholders in this company will be inclined to concur in the remark of one of their number at the meeting, that this concern is something of a *rara avis* in financial enterprises. In the matter of dividends, it has never once condescended to the 10 per cent. foreshadowed by the prospectus, and for which the vendor, Mr. Robert Boyle, gave his personal guarantee, extending over five years. For the first four years the division was at the rate of 12 per cent., and for the past two years another half per cent. has been paid. This has been done without in any way straining the accounts of the company, the maximum amount allowed by the articles of association having been placed each year to reserve, and ample amounts written off under depreciation and other heads. Mr. Boyle contemplates a fourth circuit of the globe in the new year, which will practically complete the important work of extension. It is worthy of note that the expiry of the guarantee has not been associated with any diminution of the profits of the company, but this and all that distinguishes the company from less fortunate enterprises is probably explained by the fact that Mr. Boyle holds three-fourths of the capital. There could be no better guarantee for the future than this."

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. "The Drainage of Town Houses," by G. M. Lawford. Westminster Town Hall. 7.30 p.m.
Surveyors' Institution. "Party and Party-Fence Walls," by C. H. Bedells. 8 p.m.
Society of Arts. Cantor Lecture No. 2. "The Pigments and Vehicles of the Old Masters," by A. P. Lawrie. 8 p.m.
Liverpool Architectural Society.—"Egypt as a Home of Early Art," by Rev. F. F. Grensted. 7 p.m.

Tuesday.—Society of Architects. "The Legend of Beauty," by Wyke Bayliss, P.R.B.A., F.S.A. The Suffolk-street Art Galleries, Suffolk-street, Pall Mall. 8 p.m.
Institution of Civil Engineers. "The Sale of Water by Meter in Berlin," by Henry Gill. 8 p.m.

Wednesday.—St. Paul's Ecclesiological Society.—Meeting at St. Paul's Chapter House. 7.30 p.m.
Society of Arts. "The World's Columbian Exhibition at Chicago, 1893," by Jas. Dredge. 8 p.m.
Dundee Institute of Architecture. "Electric Lighting of Houses," by F. Grant Ogilvie. 8 p.m.

Friday.—Architectural Association. "Suggestions for the Practical Education of an Architect," by T. Graham Jackson. 7.30 p.m.
Institution of Civil Engineers.—"Meters for Recording the Consumption of Electrical Energy," by C. H. Wordingham. 7.30 p.m.

The Society of Architects.—The THIRD ORDINARY MEETING of the SOCIETY OF ARCHITECTS for the Session 1891-2, will be held at the Suffolk-street Art Galleries, Suffolk-street, Pall Mall, S.W., on TUESDAY, December 8, 1891, at Eight o'clock p.m., when a Lecture will be delivered by Mr. WYKE BAYLISS, F.S.A. (President of the Royal Society of British Artists), entitled "The Legend of Beauty: a Plea for Art as an essential Element of the Complete Life."
EDGAR FARMAN, Hon. Sec.
G. A. T. MIDDLETON, Secretary.

CHIPS.

A large clock has just been erected in the parish church at Tilney All Saints, Norfolk, which plays the Westminster quarter-chimes, strikes the hours upon a large bell, and shows time on one dial. It has been manufactured by Messrs. John Smith and Sons, Midland Clock Works, Derby, to the designs of Lord Grimthorpe. The same firm are also now making other similar clocks for Aston Cross, Birmingham, Little Wenlock, and other places.

The parish church of Langton, near Horncastle, was reopened last week after restoration, including re-roofing. The pulpit, reading desk, and lectern have been carved in oak by the rector, the Rev. J. C. Walker, as memorials to his late father, who held the same incumbency for many years.

The Waltham Abbey local board have applied to the Bishop of St. Alban's for a faculty for taking away a large portion of the churchyard attached to the Abbey Church for the purpose of widening one of the streets. His lordship has, however, declined to grant the faculty applied for.

A Local Government Board inquiry was held on Wednesday week at Combmartin by Mr. S. J. Smith, as to the application from the Barnstaple rural sanitary authority for sanction to borrow £1,600 for works of sewerage for the village. Mr. Arnold Thorne, surveyor to the authority, explained the plans which he had prepared, and which showed a main sewer discharging into the sea at low water by gravitation.

In the Randolph Hall of Glasgow University, on Friday, Mr. John Nichol, who was the first Professor of English Literature in that University, and occupied the chair from 1862 to 1889, was presented with his portrait. The portrait, which is half-length, is the work of Mr. W. Q. Orchardson, R.A.

BUILDING NEWS
) ENGINEERING JOURNAL.
VOL. LXI.—No. 1927.
RIDAY, DECEMBER 11, 1891.

RCHITECTS LIABLE FOR OMISSIONS.

RE seems to be a general impression at an architect is entitled to make alterations in the carrying-out of a g contract without the consent of his No doubt custom has given a sanc- various acts which are supposed to ıe employer. For example, in the ɔn of a contract, it may be deemed y to order extra labour in the ions, should the circumstances re- ınd the architect appears to have a ed authority to do that which seems absolutely required, in the interest of loyer, for the safety of the building. similar reason, circumstances may the omission of something specified ded in the bill of quantities, and the t, as an agent of the employer, eem it to be within the scope employment to give his sanc- the omission of some item, ıat of a concrete foundation. ıot so clear that a Court would this opinion, as the decisions that ɔen given are somethat conflicting satisfactory. If we suppose that ng has been omitted like the concrete ion, through the neglect of the t in seeing it put in, there would be le doubt that the owner would have ground to complain, and refuse to d by his architect's decision, and the ıse of "Rogers *v.* James," decided the ıy before the Court of Appeal, is of to every architect who imagines that worded in such a manner as to place uestion which may arise during a in his own hands, as between him- his employer, is final. In other contract clause as that often intro- ves the architect no power to bind ployer or to prevent him from an action for negligence if he it. The case to which we allude ıeral interest to the profession, and rd by the Master of the Rolls and ustices Lopes and Kay, the facts ɔeing these. An architect brought n to recover £123, balance of an or services rendered to the defendant ection of a house at Bromley, Kent. er counterclaimed for damages for ce on the ground that the plaintiff properly supervise the building, in ɔnce of which the builder omitted to in concrete into the foundations and rk. The plaintiff denied negligence, d that in giving his final certificate ted £82 in respect of the omissions sum certified to be due, and he d that this certificate was binding defendant under a certain clause of ract, which provided that the de- the architect with respect to the state, and condition of the works , and in respect of any and every that may arise, shall be "final and appeal." The action was tried at e, when the jury found that the had been guilty of negligence, and erdict for the plaintiff on the claim nd the defendant on the counterclaim The plaintiff thereupon moved for on the counterclaim, or for a new was contended for the plaintiff certificate was binding upon the , and the reduction of £82 from the ble to the builder was conclusive as laintiff and defendant. The Court dismissed the motion without calling on counsel for the defendant, and the Master of the Rolls said that, the jury having found negligence, the only material question arose upon the counterclaim. Upon the question of certificate being final as between building owner and architect, the Master of the Rolls said such was not the law. "The certificate was final as between building owner and the builder. Any question as between the building owner and the architect would not be decided by that certificate. As between the building owner and the builder, the architect had, in the honest exercise of his judgment, awarded a sum which the building owner could not question. As against the architect, the building owner could question that. The jury had found that the architect was negligent, and that he had not awarded sufficient." The judge was satisfied with the verdict, and a new trial was refused. Lord Justice Lopes concurred. He said the contract clause gave the architect no jurisdiction to decide any question of negligence as between himself and the building owner, and the latter could bring an action for negligence against the architect. The jury found that the £82 allowed by the architect was not sufficient, and they awarded the owner a further sum from the architect. The judge was satisfied with the verdict, and that Court could not disturb it. Lord Justice Kay also concurred.

The decision places beyond dispute the dictum that an architect's final certificate is not binding upon the building owner when there is a disagreement between them; it is final only between the two parties to the contract, for, as Justice Lopes stated, the clause of the contract gave no jurisdiction to the architect to decide any question of negligence between himself and the building owner. But there is a general opinion that the architect's final certificate is binding upon clients, and this view appears to be upheld by the case of "Laidlaw *v.* Hastings Pier Company," in which the decision of Lord Chief Justice Coleridge was to the effect that when an architect or engineer is clothed with certain powers, and when he exercises them, they are to be conclusive on the owners who have placed their own agent in the position of control. In this instance the engineer's certificate was held to be conclusive against the owners. The clause vested exceptional powers in the engineer's hands. But the usual arbitration clause as to disputes between architect and the contractor applies to disagreements between these parties only, and not disputes which may arise between employer and his architect. The circumstances of the case as reported are at least of instruction; the architect finds the builder has taken advantage of his absence in omitting certain concrete, and deducts a sum from the final certificate for the omission — whether it is sufficient or not is another matter. The defendant makes a counterclaim for negligence, and practically claims again for the omitted work by making the architect liable. The law supports the allegation by declining to accept the final certificate. They are at least facts which should teach architects something. That they are held responsible for omissions by the builder, whether through neglect or by taking advantage of the architect's absence, there cannot be any question. It is equally certain that final certificates given under a clause reserving full powers to the architect will only be final between the building owner and the builder. We can well imagine a number of things left out during the progress of work, of which the architect knows nothing; the contractor may think the omitted work unnecessary, or he may try to evade the specification. It would be a hardship to hold the architect liable for these omissions, or to say that they are owing to his neglect. Yet it is equally unfair that the employer should not have the proper deductions made. The only way of avoiding these alternatives is the employment of a clerk of works.

BATTERSEA TOWN HALL COMPETITION.

CONSIDERING that the proposed Battersea Town Hall and Parochial Offices will be a large and important undertaking, and will occupy a commanding site on Lavender Hill, it is to be regretted that the vestry has not deemed it desirable to exhibit the whole of the twelve designs submitted in competition, particularly as the merits of not a few entitle them to the privilege of a review by the professional journals. We are, therefore, compelled by circumstances to describe only the first and third designs. Many of the competitors feel that they have not received the attention and consideration which their efforts deserve. The conditions issued to competing architects give a rough scheme of plan which has been followed by many. The fall of the ground northwards of the site has been well utilised in some of the plans. Mr. E. W. Mountford's design, marked "C," of which we are able to give a perspective view, and which has been finally selected, shows a well-studied and skilful distribution of the offices, with spacious roadways. The author has taken care to provide good approaches and entrances to the parochial offices and public hall on the south and eastern sides, and so to economise the area of the site as to leave room for future extension or building—a consideration which no doubt duly weighed with the assessor, Mr. W. Young. Mr. Mountford has connected the official portion of the building with the public hall by a one-storied vestibule and hall, by which communication between the offices and hall is secured, while at the same time the integrity of each building is maintained, and, if need be, the hall can be shut off from the official block for general assemblies and public gatherings, the public being admitted by a *porte cochère* or projecting carriageway, which is made a nice feature in the design—though we hear this projection will be omitted in the amended plan. The axis of the public hall slightly deviates to the east. The plan, as sent in, has a recessed centre, with circular porch; the entrance is central, and leads between two waiting-rooms into a large hall, 56ft. by 28ft., having the flight of main staircase opposite the entrance vestibule, with right and left wing flights. From this hall proceed two lateral corridors, which extend uninterruptedly northwards, giving side access to the offices and to the large hall, where they are 9ft. wide. Taking the west side of official block, we have the vestry clerk's offices at the front angle, slightly projecting as a wing, with circular corners in the façade, north of them coming the churchwardens', the trade accounts' and the rate collector's offices at the end. The east side is taken up in the same order with the surveyor's offices, forming a corresponding front wing at corner, and the medical and sanitary departments. There is a convenient entrance from the side road, between the surveyor's and medical departments, to council chamber, and, a little further on, another side entrance to coroner's court above. All these offices are well lighted from the side roads, and the corridors from a central courtyard, which occupies the space between them. Behind the staircase are placed a block of lavatories, excellently ventilated into the courtyard. The importance of having separate entrances to the surveyor's and sanitary department cannot be overrated, and the vestry offices are also near to the main entrance and staircase. The public hall is 98ft. by 59ft., exclusive

of platform recess at the north end. There is a reception-room near the domical hall, which will serve as a crush-room, and the entrances to the hall from side corridor and the exits along the latter to the outside are ample.

On the upper floor of the parochial offices is the council chamber, 55ft. by 35ft., forming the whole recessed portion of the façade, with a spacious committee-room on the west, and a members' library at other end, occupying the wings. Along east side is a members' cloak-room, committee-room, and coroner's court, 40ft. by 25ft., at the north end. The staircase to gallery is at the south-west angle of the hall. The landing of main staircase opposite council chamber is well planned. Side flights give access to two galleries, which return on each side to the council chamber, and a pleasing feature is made of this arrangement. The sections show well-studied features; a three-centred elliptical ceiling of fibrous plaster over great hall is divided in seven bays by ribs encasing the iron principals. The hall block, owing to the fall of ground, has been utilised; the second and third halls are below the large one. The council chamber has also an elliptical ceiling. Ventilating exhausts are shown. The elevational treatment is in a Free Renaissance brick style, effect being given to the front by a high hipped roof, with cupola, pilasters, and boldly-projecting wings. Space prevents our giving a detailed description of the second premiated designs, by Mr. Henry A. Cheers, owing to its removal; but the general plan is well conceived, and the elevation, which we shall illustrate, is ably treated in its parts; a centre and wings, with stair approach to first-floor level, are striking features.

The third premiated design (M), by Messrs. Reed and Macdonald, Oxford-street, has a clever arrangement of parochial offices; the block of buildings is rectangular, with an imposing front elevation, and forms a hollow square, with staircase, lavatories, and conveniences, making a projecting block in the centre, round three sides of which is an area for light and air. On the ground floor is a central entrance vestibule with waiting-rooms on either side, one for auditors, access to which is obtained from a spacious entrance hall, which extends in length the whole distance between the side blocks, and is 23ft. wide. Adjoining these waiting-rooms, and forming slightly projecting wings in front, are the vestry general office on the west side, 26ft. square, and the surveyor's general office at the east end, of the same dimensions, these rooms being entered from the same hall. The western block, which faces the return side, comprise in the following order a strong-room and w.c., the vestry clerk's private room, the vestry clerk's office, a staircase specially intended as an access to the coroner's court on the next floor, then a room for trade accounts, and a churchwardens' room at the end, all these rooms approached by a corridor from the main hall. A like arrangement on the east side is appropriated to the surveyor's office, his drawing office and plan room, staircase, medical officer, and sanitary inspector, respectively. The rear block between these side ranges comprises the rate collector's office, 38ft. 6in. by 21ft. The central staircase, facing the main entrance, and the cloak and lavatories block are in the centre axis, and are compact and well lighted and ventilated by the area. On the upper floor in the front is a council chamber 55ft. 6in. by 35ft.; this extends partly over the hall below, the inner wall being carried by a range of six columns, which divides the hall equally. At the two ends of council chamber are committee rooms. The upper floor over west wing contains the coroner's court, 34ft. 6in. by 30ft. at the rear end, with coroner's room and witnesses' waiting room, and on the east side a members' library or tea-room, and the residential apartments for housekeeper, with separate entrances, at the north end. This plan, therefore, is ⊔-shaped, the rate-collector's block not being carried up. A good side staircase entrance is provided for the coroner's court, which will be used for those specially attending cases without having to go through the main corridors. The public hall block is ⌋-shaped; the vertical portion forms the hall, approached by side corridors, and separate entrances at the south end. The hall is 88ft. 9in. by 48ft.; the north end has rounded corners and platform. The main entrance to it at the south end next to the rear of the parochial offices has a spacious inner hall, adorned by coupled columns. Ladies' and gentlemen's retiring-rooms are placed on either side of entrance-hall, and there is a covered colonnade approach to the three main entrances, the two side ones being corridors. The other portion of the block comprises a second hall 40ft. by 25ft., with reception-rooms, serving and retiring rooms. The main side corridors to public hall are lighted by skylights, and the front retiring-rooms are also lighted by the same means. The elevation and the sepia perspective of the parochial office block represent a Renaissance treatment; the centre recessed portion of front is enriched by engaged columns between circular-headed windows. This portion is emphasised by a high-hipped roof with centre cupola, while the wings are surmounted by ornamental parapets. The general treatment is in a plain style of brick and stone. The sections show some good detail in the interior treatment of hall and council chamber; the public hall is coved, and intersected by groins for side lights. A clever arrangement for public gallery to council chamber is obtained over councillors' corridor on the first floor. Air-pump ventilators are shown over the great hall. It is a pity so good a plan of offices should have been spoiled by the narrow roadways shown round the main block, which measure only 13ft. in some cases.

PARTY AND PARTY-FENCE WALLS.

At the ordinary general meeting of the Surveyor's Institution, held on Monday evening last, an interest paper on the subject of "Party and Party-Fence Walls" was read by Mr. C. H. Bedells (Fellow). In commencing, the author alluded to the Code Napoléon of France and the Code of the United States, which, he said, "both deal in a more or less comprehensive way with these questions, but have, so far as I know, no parallel in our English Statute-book, except in isolated instances, such as the provisions of the Building Acts in force and operative within the Metropolis and some few towns, and even these are by no means comprehensive. It may be interesting to you if I briefly note one or two of the provisions of the French law. Article 646 gives every proprietor the right to compel his neighbour to determine the boundaries of their contiguous properties, such determining to be at their common expense. By article 653, in towns and fields, every wall which serves as a boundary between buildings, even to its base as between courts and gardens, or even between inclosures in the fields, is to be presumed 'party' if there be no title or mark to the contrary. 655. The reparation and rebuilding of party-walls are to be at the expense of all those who have any claim thereto, and in proportion to the claim of each. 663. Each inhabitant of a town or suburb can compel his neighbour to contribute to the construction and reparation of the inclosure forming the boundary of their houses, courts, or gardens situate withing the said towns or suburbs. The height of the inclosure is to be fixed according to particular regulations or constant and acknowledged usages, and in default of such usages and regulations according to the direction of the Code." In the United States there were officials known as "fence viewers," and the Statutes regulated the erection and repair of boundaries. Persons liable to contribute be sued for non-repair, and in defau one party the other could repair an cover. A new boundary might be erected on one's own and half on one's neighbour' We shall, said Mr. Bedells, clear the if we start with an attempt to answer the qu "What is a party-wall?" Mr. Justice the case of "Watson v. Gray," describ term "party-wall" as a "popular rather legal one," and one which appears to be four different senses. First, as describing erected on land belonging to owners of adj lands in equal moieties as tenants in co This is the most ordinary case, and, if th boundary line between say, two houses, be ascertained either by documents or ownership, the law will infer that t ownership in common of the wall and of i so that the owner of each house has not a s and distinct half, but an undivided mo both the wall and the soil on which it st the user of the wall by two proprietors *primâ facie* evidence of its being their c property. Then in the case of a party-wa under tenancy in common, what were the of the respective tenants in common, an their liabilities? Neither party might ra wall so as to increase the burden upon it o fere with his co-tenant's user without perm Should one tenant heighten the wall, th might knock off or remove the addition. other hand, he might rebuild the wall, if n without subjecting himself to action for t though the textbooks do say that an ac the case in the matter of waste might li such circumstances, or in any other wh tenant in common misuses the commo perty. There was no common-law r underpin or undermine party-walls, u could be done without injury to the neig house ("Bradbee v. Christ's Hos Secondly, where the wall is divided into tudinal halves, one half standing on the each of two adjoining owners. Wh boundaries of the land of adjoining owne known, the common law on the subject the property in a party-wall built expense followed and was the same as the land on which it stands—in the con tion of the law, in fact, it was treated constituted two distinct walls. In this ca pose one owner wanted to add, say, a sto house, he might raise upon his half of t without asking any permission of his ne He would be liable for any damage his neighbour's premises by anyth might do to the wall, or if accident through its ruinous and unrepaired co Of course, if a man erected a wall half on and half on your ground, you might p what was upon your land, though in so d remainder tumbled down, and if on raised a wall on both moieties you migh the part erected upon your own; but wall had long stood between two premi on the lands of two owners, it seemed, in settled recognition of a possible right of we must treat it for practical purposes a under what Mr. Justice Fry in 1880 before "Dalton v. Angus") made h division, but which I prefer to deal wit viz., a wall longitudinally divided, eac being subject to an easement of user owner of the other moiety, and in su neither owner would pull down his ow of the wall without being liable for d the rights of the other. The other r class (borrowing again from Mr. Jus was where the term "party-wall" wa to a wall which belongs entirely to o owners of adjoining land, but which is s an easement of user belonging to the oth rights here of the parties, of course, unequal; the owner of the dominant had the right to use, but could not in use without consent, could not deal with under the wall, nor hamper the adjoini in his use thereof so long as the limited maintained and provided for. An eas this kind was a very awkward thing deal with, seeing that, if user were perm acknowledgment was given that it was and not as of right. With party-fen as with party-walls, questions of limit o boundaries, as to who originally co the wall, and acts of ownership were In the Act of 14 George III. cap. 58, adjoining each other with independent

first time contemplated, and for the first ron doors were required to openings in walls. Section 28 determined for what es a party-wall might be cut into *without* —viz., for inserting the end of a new back nt wall, a brestsummer or story posts, in stone steps or stone landings or timbers arers for wood stairs, stone corbels for ey jambs, girders, beams, "purlings," g or trimming joists or other principal s, perpendicular recesses into any party- ot less than 13in. thick for walls and piers n (subject to restrictions), and for cutting tings. "But any person who shall cut party-wall for any of the purposes afore- all immediately make good and well and ally pin up with brick, slate, tile, shell, or edded in mortar every defect which shall asioned by the cutting of any such party- and no party-wall shall be cut for any of rposes aforesaid if the cutting thereof will , displace, or endanger the timbers, eys, flues, or internal finishings of the ing buildings." Party-walls might be if, when so raised, they were conform- o the Act. If the owner on the other nake use of the raising, he must con- to the expenses. The form of party-wall is much the same as before, only it is im- t to remark that party-fence walls were ed, as well as party-walls and party-arches. party-fence walls might be raised by the of one side, but were not to be used as walls unless of sufficient thickness. If not owner might pull down such fence-wall ce, and build a party-wall in lieu thereof, ojecting more, however, than 7in. beyond ntre-line. The adjoining owner must con- to the expense if he use it other than as e-wall. We now come to the last of the o longer in force—viz., 7 and 8 Vic. cap. 44). For the first time we get a definition t a party-wall is, and this definition, as he definitions of building and adjoining , are continued in effect in our present ng Act of 1855. The provisions of the pply to the reparation, rebuilding, and of party-fence walls, in respect of which e is required to be given of either one or months. The Act assigned to official es and district surveyors many of the duties now devolve upon the "three surveyors." orthy of note that in the case of rebuilding a party-wall by a building owner, this Act upon him not only the whole cost of the nd of making good to the adjoining owner's es and the payment of all surveyors' fees, gave to the adjoining owner a right to reasonable compensation as to the said referees may seem proper for any loss the adjoining owner shall have incurred son of such work." The Act also dealt subject which is still a source of some lty—viz., the building of an external wall t a party-wall, and the subsequent rights parties in the old party-wall left standing, the ground upon which it stands, matters , within certain limits, were left to the ination of the official referees. Section 31 d party-walls to be raised, and, as in us Acts, gave a clear and unmistakable to the original adjoining owner to use a party-wall, and a clear and unmistakable to the original building owner to be repaid portionate part of the cost for the portion was so used, and of the chimney-stacks ging thereto. The powers given in the us Act with regard to party-fence walls largely continued in the Act under con- tion; and, in the main, I think, were able and useful provisions. A building before building on a vacant site, where the ding site also was vacant, had to give previous to the adjoining owner, and, if the latter ected, the building-owner was bound to his wall as a party-wall, a clause the repeal ich there is no reason to regret. To ex- the question in the light of the Metropoli- Building Acts now in force:—"What was y-wall under the Building Act?" The Act es the definition:—"Party-wall shall apply ry wall used, or built in order to be used, as aration of any building from any other ng, with a view to the same being occupied fferent persons." In dealing with party- under the Metropolitan Building Act, it ot, as a general rule, needful to determine, uld seem, whether the parties had divided livided moieties in the wall; whether the wall was the property of one party with an ease- ment by the other of user; whether the wall was used by two owners as tenants in common, all which considerations were material in questions affecting party-walls, in districts where the common law and not statute law is in opera- tion. But if in part a wall were a party-wall was the whole of the wall of necessity a party- wall? No, for it had been held that, so far as those buildings extended on both sides of the wall, it was a party-wall within this Act. Then as to height. The Bristol case of "Watson v. Arnold," Law Reports 8 Ch. App. 1084) was given in the Digests as useful, though only by analogy. It was a case under a Local Improvement Act, and it was held that a wall might be a party-wall to such a height as it is common to two buildings, and cease to be a party-wall for the rest of its height. In view of the Metroplitan Buildings Act defini- tion of the party-wall, the author did not see how the upper part could be said to be "used" or to be "built to be used" to separate, with a view to occupation by different owners, and therefore be a party-wall, but in the face of the recent case of "Williams v. Bull," to be here- after referred to, it would seem the upper part of a party-wall must be so regarded, for the present, at all events. The Act defined who were owners, and who the building and adjoin- ing owners ("owners" being used not in its strict sense, because there is no individual owner- ship). "Owners" applies to every person in possession or "receipt either of the whole or any part of the rents or profits of any land or tene- ment, or in the occupation of such land or tene- ment, other than as a tenant from year to year, or for any less term, or as a tenant at will," and the owner desirous of executing any work in respect of the party structure, shall be called the "building owner," and the owner of the other premises shall be called the "adjoining owner." But no owner on a new foundation might erect half his flank wall on his neighbour's vacant land, "Barlow v. Norman," and not only if he does so might his neighbour use it without pay- ment, but he might remove the part standing on his ground. It was often said that where the Building Act Clauses are not specific the "owners" must find their rights and remedies at common law. But it was needful to learn that the rights given by the M. B. Act are in substitution of those which exist at common law, and are not merely an addition thereto. The rights given to the B. O., "these are the only rights he has, and where by common law he has in ordinary cases a right, he has not in the Metropolis if the common law right is not covered by these rights." "I may here say," continued Mr. Bedells, "that without notice a building owner, it seems, cannot do anything to his own side of the wall, even if it belongs wholly to him and yet is a party-wall under the Act. This seems hard. 2. A building owner may pull down and rebuild a party-wall if it is so far defective or out of repair as to make it necessary or desirable on the same terms as to cost. 3. He may pull down any timber or other partition dividing the build- ings that is not comformable to the Act, or to either of the older Building Acts which next preceded this Act, and build a proper party-wall instead, each owner bearing his due proportion of the cost according to the use he makes of the wall, and also as to the thickness of wall which his building requires. I conclude the additional thickness may be halved between the two owners or divided in proportion to their use thereof. 4. In the case of buildings having rooms or stories the property of different owners inter- mixed, a right to pull down such of the said rooms or stories, or any part thereof, as are not built in conformity with this Act, and to rebuild in conformity with this Act, on the same terms as to cost. This clause seems to require further explanation. 5. A right to deal with buildings communicating over public ways. 6. A right to raise at the building owner's ex- pense any party structure, permitted by this Act to be raised (that, I take it, means—when, by raising the wall, the lower part is thick enough to pass the schedule for such heightened wall), or any external wall built against such party structure at his own cost, and upon con- dition of making good all damage occasioned thereby to the adjoining premises, or to the in- ternal finishings and decorations thereof, and of carrying up to the requisite height all flues and chimney-stacks belonging to the adjoining owner, on or against such party structure or external wall." "In the case of 'Stokes v. Standard Bank,' the word 'raise' was interpreted as wide enough, in conjunction with other clauses fol- lowing, to cover lengthening the wall in a *downward* direction. 7. He may pull down any party structure that is of insufficient strength for his intended building, and rebuild it of sufficient strength on the like condition as to cost and as to making good damage to adjoining premises or to the internal finishings and decorations thereof. 8. He may cut into any party structure at his own cost, and on condition of making good damage to adjoining premises. 9. He may cut away any footings, chimney-breast jambs or flues projecting from the party-wall in order to build an external wall against it, or for any other purpose, on the same conditions as to payment of cost and damage. And although they are upon his side of the wall, he cannot deal with them without a proper award under the Act, nor cut away the shafts or chimney-breasts without the certificate of the district surveyor. 10. A right to deal with a wall overhanging the ground of building-owner. 11. A far-reaching clause, giving a right to perform any other necessary works, incident to the connection of a party structure, to premises adjoining thereto." The facts of a case which raised an interesting question under the Metro- politan Building Act, 18 and 19 Vic. cap. 122, were as follows:—On May 29th, 1884, the plaintiff served on the defendant a notice, under the Metropolitan Building Act, that he intended to pull down and rebuild the party-wall then existing between the houses of the plaintiff and defendant, and in pursuance of that notice he pulled down the wall. The plaintiff then rebuilt the wall, partly on his own and partly on the defendant's land, to a greater height than the defendant's house. On February 6th, 1885, the defendant served on the plaintiff a party-wall notice, and in pursuance of that notice he pulled down his own house, erected a new house, raising it to a greater height, and for that pur- pose cut into and used the external wall which had been previously raised by the plaintiff. The wall was built for half its thickness upon land of the defendant's, and it was therefore con- tended on his behalf that it was a party-wall. The plaintiff, on the other hand, contended that it was an external wall, and the defendant was not entitled to make use of it without paying for the portion of the wall so cut into and used by him. Counsel for the plaintiff argued that the wall in question, so far as it did not separate buildings, was an external wall and not a party- wall, that the provisions of Part 3 of the Metro- politan Building Act did not apply in the absence of a notice by the defendant under the Act specifying the wall the defendant cut into, that a wall might be a party-wall for some of its height, and above that the property of the adjoining owner. The defendant had no further rights than were given by the Metropolitan Building Act, the effect of which was to limit the right of owners in the interests of the public. Whether the wall was half on the land of the defendant was immaterial, for the external wall was by statute, for the purposes of the present case, the property of the plaintiff. Counsel for the defendant argued that the case was covered by Sections 84 and 93 of the Metropolitan Building Act (18 and 19 Vic. cap. 122). The adjoining owner was only liable for expenses incurred by the building owner upon his requisition. When a party-wall which was not defective was pulled down and heightened, the building owner must incur all the expenses. Mr. Justice Matthew, in giving judgment for the defendant, said he could not find any grounds of the liability for which the plaintiff had contended. The sections of the earlier statutes referred to had been repealed, and were not incorporated in the Metropolitan Building Act. Under the Building Act, 1855, the whole measure of liability was that, where any building owner had incurred any expenses on the requisition of the adjoining owner, the owner making such requisition should be liable for all such expenses. To say that the expenses were not to be borne by the building owner seemed to be supplying in the Building Act what was not there. Judgment was given for defendant with costs. On moral grounds the decision is unfortunate, for supposing the wall from the height of 1ft. 3in. above the lower building upwards is an "external wall" and not a "party-wall," what right has the owner of the lower building

to serve a party-wall notice, or to use such wall at all against the wish of the owner of such external wall? Be this as it may, the moral of the uncertainty appears to me to be that, until the law is amended or authoritatively expounded, it is most desirable that when any party-wall is raised it should be determined under what conditions the adjoining owner may use the raised wall, or some agreement independent of the award be arrived at between the building and adjoining owners on the subject. Upon party-walls as dangerous structures, the author had little to say. First, the condemnation of a party-wall as "dangerous" acts as waiver of the three months' notice, as well as rendering the adjoining owner liable for expenses of wall rebuilt, hence the well-known, but discreditable, practice of endeavouring to induce a district surveyor to condemn a doubtful wall as dangerous. One difficulty I have observed in practice I may refer to. In a case where the County Council serve dangerous structures notice upon a lessee for a short remaining term of years with no covenants on the part of lessor or lessee specifically referring to party-walls, the County Council serve the occupying lessee. In such a case, though probably not liable, at all events not to the full extent to his landlord, the onus of complying with the notice lies upon him, and if, in default, the County Council do the work, he is saddled with the expense, for in such a case the "one owner" cannot require that the other owners shall be summoned ("Debenham *v.* Board of Works"), with or without the vexation attendant upon summons for recovery of the same and penalties, &c., while he has no very long term or considerable interest in the premises, and little prospect of recovering the money from his lessor unless by means of more or less costly and uncertain litigation. Probably the path of wisdom in such a case, although not one relished by the surveyor or his client, is either to do no more than absolutely needful to comply with the notice, or make the best terms with the lessor. If the outlay is serious, a lessor can often be persuaded into granting an extension of term. If so, the hardship, as it is thought, is less felt, probably, on both sides.

A discussion on Mr. Bedell's paper, followed by a unanimous vote of thanks, brought the meeting to a close.

THE ARCHITECT AND HIS ARTISTS.

At a meeting of the Sheffield Society of Architects and Surveyors, held on Tuesday evening, a paper entitled "The Architect and his Artists" was read by Mr. William H. White, Sec. R.I.B.A. The author explained that he used the word "artist" not in the exclusively æsthetic sense which it now possesses, but in the sense of a handicraftsman—the sense in which it was understood from the fall of the Roman Empire till the close of the reign of Louis XIV. Not the least remarkable result of all the researches yet made into the history of ancient and mediæval buildings was the uncertainty of their original in respect of design. There were certainly records of men in the 14th and 15th centuries who were imported from one country to another to reconstruct or superintend the reconstruction of cathedrals and other buildings. But who, or what the men were who, in the 12th and 13th centuries, inspired the design of structures, absolutely identical in arrangement and methods of construction, though situated at remote distances from each other, in different countries, and among different peoples, was still matter of inquiry and surmise. About 1874 Mr. Emmett, an architect, propounded the theory that these mediæval buildings were planned and designed by the "inspired" workman, without the intervention of an architect, and the lecturer suggested that Mr. Norman Shaw's arguments on the question, "Architecture: a Profession or an Art?" tended to show that, if the public wanted "artistic" architecture, they must employ three men instead of one to advise them how to do it—an architect, an engineer, and a surveyor. For himself, he thought that the "inspired workman" of 1874 was less difficult to believe in than the "inspired draughtsman," regarded in 1891 by a limited circle of mutual admirers as the only possible architect. The lecturer held that it should not be the grouping of pupils around a specialist, to study theoretically the speciality he practised, but the study by all young artists of the one grand art, architecture, on the buildings themselves, in daily converse with the executants, under the eye of the master or his elder disciples—a system of which only a rudiment remained in England, but which still existed in France, though in a modified and restricted form. France, moreover, had preserved that custom of continuity among the craftsmen in the various building trades, and thus had, to some extent, insured herself against such strikes as we now witnessed in England. In Paris, and France generally, the architect was the sole and supreme master of the work, and his relations with the master-workmen were constant and direct. He made his contracts, not with one capitalist, but with a dozen master-tradesmen, who each worked under his direction, and who looked to him only for orders to fix materials and assist each other at the several stages of the work. This fact rendered it essential for an architect in France to be a constant visitor on the works with the superintendence of which he was intrusted. The consequence of this system was that the business of architecture was more equally distributed in France than in England: the architect took less work and made less out of it, for it cost less in execution. Obviously, there were fewer rich architects in Paris than in London; but the average income of architects in the French capital was larger than in the English one. At the same time his honorarium was less, and it was subdivided as follows:—Preparation of the design, specifications, and estimates, 1½ per cent.; conduct of the work, 1½ per cent.; and verification and settling of the accounts, 2 per cent. If, said Mr. White, the British public were only as shrewd as foreigners thought them to be, they would pay the "artist-architect" 2 instead of 5 per cent. for his work, and then there would be less heard about the art to the exclusion of the science and business than at present. One of the disadvantages of the English system of general contract was that "provisions" had to be made in contracts for works to be intrusted to the specialist, and on these the general contractor exacted his profit of, say, 15 per cent., the quantity surveyor his commission on both items of 2½ per cent., and the architect again charged his honorarium of 5 per cent. on the total amount, so that on a provision of £500 the sum it would cost the client would be £618 17s. 6d. If the architect were, however, to arrange with the craftsmen independently of any contractor for work to the value of £500, he might save his client nearly £94, and still receive £25 for his design, superintendence of the work, and final revision of the account. The general contract system, introduced by the Government early in the century, had largely aided the development of manufacturers' discounts—sometimes ludicrous in their proportions—from which the contractor derived his wealth; and not, as his men often alleged, from sweating them. He hoped that the general contractor might one day be dispensed with altogether, not only for the sake of the architect and his artists, but also for the sake of the art itself. Of course, there was a danger to be guarded against in any reversion to the old question of an architect as the employer's agent, purchasing materials and employing labour, and care should be taken that the present desire for the unity of the arts did not result in commercial union. Having pointed out that the mediæval guilds did not teach, but merely examined, and that the technical education of those days was an affair of master and apprentice, the author showed that it was only on the decay of the guilds that academies were formed, and a few artists in the same profession were, by personal favour, set above their fellows. He held that there were excellent reasons for preferring the principle of the mediæval guild to that of the modern academy, and that it was better for architecture that it should be a "profession" of average ability rather than consist of a few academic "stars." In conclusion, Mr. White said: "The experience of the past half-century suffices to show that the architectural art which a comparatively recent generation believed to be good, the succeeding generation believed to be bad; and architectural art of the modern type applied to a building seems to be neither tangible nor capable of progressive development. Scientifically and artistically constructed buildings are what the educated public want, and if they are sometimes hard upon an architect, it is because of his bad building, not of his bad art."

THE SOCIETY OF ARCHITECTS

The meeting place of the Society of A tects was changed on Tuesday last one night only" from St. James's Hall, P dilly, to the Suffolk-street Art Galleries Wyke Bayliss, F.S.A., the President o Royal Society of British Artists, who promised to lecture before the Society of A tects on that evening, having invited members to view the winter exhibition now on the walls of the galleries. The new depa was much appreciated, and a large numb architects and their friends, including ladies, availed themselves of Mr. Wyke Ba courteous invitation to spend an hour befo lecture commenced in examining the pic The exhibition is a strong one, especially in scapes and sea pieces, and was reviewed issue of 30th October last. The meetin held in the large central room, and immed behind the lecturer's reading-stand hung Bayliss' large interior of Westminster A in which full justice is done to the majestic h of the north aisle of nave, as seen from beyon crossing. Mr. H. Roumieu Gough, F.R.I. occupied the chair. The preliminary bu included the passing of a vote of condolen the widow and family of the late Mr. Alex Stuart, of Exeter, Member, whose recent at the age of five-and-thirty prematurely a career of much promise; the announcem three nominations for membership, and the tion of the following four members:— Chadwick, of Petersfield, Hants; John Alc Davenport, of Heath Bank, Nantwich; W Leck, of Johannesburg, S.A.R. (whose c was selected in competition several years for the Society's certificate of members and George William Nicolay, also of Joha burg, S.A.R.

Mr. Wyke Bayliss then delivered an elo and impassioned address which he had ent

THE LEGEND OF BEAUTY: A PLEA FOR ART ESSENTIAL ELEMENT OF THE COMPLETE L

He explained that he proposed that even do two things—to tell a story and to del message. The message he would unfold proceeded, but the story he would tell at It was one of the very oldest known human race, and was to be found elements in the myths and traditions of races, although somewhat varied in the te The story was that of one who, although the a king, and dwelling in a palace of more regal splendour, descended from that high and became for a time debased into the sem of an ugly beast. Thus he remained, the ugly thing in the palace, until a Beauty st down to him, pitied his unfortunate cond kissed him as he slept, notwithstanding his ness, and so raised him by her love to his or position and rank. This was the legend u lying the stories of Endymion and Dia Cupid and Psyche, of Cymon and Iphige Beauty and the Beast—it was, in fac poetical rendering of the tale of the influe art on our lives. Now the word "beast" w ugly one, and he did not intend to fling any person's head—he certainly should obj its being applied to himself—and yet was true that it might justly have been appl every one of those present, as it still appl all who had not seen the vision of beauty! it not the case that, just as the King's son have remained a beast to the end of the st he had not been awakened by Beauty, should have remained savages had not the presence of Art stooped over us, and reveale self to us as the King's messenger. Ther he trusted, no mistake as to the meaning story, although he had availed himself of a of speech. Art was not a mere plaything was a living force—a force that neith individual nor the nation could afford to gard, for it was an essential element complete life. He had by no means gotten the other messengers that to men the will of the King—those of and Truth, e.g.; but he specially desir speak that evening of one messenger- These taught us that men were surround every side by messengers of evil: that k ledge was not received by inheritance, bu it came to us by messages which must be dilig sought after. There were yet other messe —there was, for example, Science, which t that the beauty which we saw around us w

developments of a single germ; there was ogy, which told us that the world was but vely wreck of a once still lovelier paradise. h of these messengers was true it was not urpose to examine that evening—perhaps ere true. But the messenger Art said that ad only to lift their eyes to see that there et much of beauty in the world around, urther, that it was oppressed, wasted, and yed by evil. When we looked at the varied rds of the beautiful among different nations, re led to ask whether it was possible to n the beautiful. Our ancestors in this ry dyed their teeth black and their skins r in the belief that it improved their rance, and at the present day an African was judged, like an ox, by her weight. ct, we knew not what was good or ful; but it was the province of Art cover this to us. The revelation of the ful was the true aim of art, just as vangelist set before us the divine pattern of ess. As the philosopher searched patiently th, so the artist sought the beautiful, and voured to translate it in the medium of his . But he would next look into the on: What was this thing which we called y? There could be no doubt that our first r, Eve, must have been very lovely, but in was in colour a deep copper—not the hich corresponded to our idea of the beauti- We most admired women who, in the words old song, had "Hands lily-white, carna- ips, and cheeks of rosy hue." Was there asure of what was beautiful but that of —was there no standard? He believed was. Let them adopt the customary plan in doubt as to the meaning of a word, and n the first place to the dictionary for light what was beauty. They would there find y defined as that which pleased the eye, or, etically expressed, that which gave pleasure mind. Let them put it to the test, and ain if, in fact, that which pleased the eye gave most pleasure to the mind. One er evening a friend took him into her ry to show him what Cornelia rightly re- d as her jewels—her children. There were of them, one in particular being a fair-haired yed little girl. The mother, in her pride, d down the coverlet, and there, nestling in ir arms of the child, and hugged close to reast was a hideous black doll, battered of and scantily clothed in soiled and tattered nts—one that would have seemed as a ful apparition if suddenly shown a person ned from sleep. Yet the little girl had er doll, as like to a child as this one locked n her arms was to a beast. That was well ed and fair, and was taken out for walks, iis she brought to bed with her. She liked auty, but she loved the beast. The beauty ood enough for company, but for comfort, nsolation, for loving tender affection com- a child to her battered black friend. The ndoubtedly gave pleasure to her mind—was erefore, beautiful in her eyes? Should we ss the problem by saying that, after all, it nly a child, who did not consider the ques- of beauty? Then let them take another and see if this apotheosis of ugliness was iar to childhood. Let his hearers cross the nel and enter any of the great cathedral hes of the Continent—say Chartres, to take iliar example—and there, side by side with exquisitely-carved, richly-apparelled, and lled statue of the Mother of Christ, was a image, *Une vierge noire:* and as you there you would see the pilgrims from all pressing forward towards the shrine of this doll. It would receive an affection and ct that were never paid to the most beautiful nna by Raphael. It appeared, then, that ision of the beautiful was not seen by the of childhood, nor was it perceived by the r gaze of after years. They must look here for those who could behold its dour. Men and nations had to be led y and patiently to appreciate it. How years did it take to inform the people of nd that the willow pattern was not quite all was to be desired in china earthenware, and many centuries would yet be required e the Chinese people would realise that ips, after all, God knew best the proper size hape for ladies' feet? It was not the first he second vision of beauty which trans- ed the beast into the king's son. If they led the fairy tale, they would recollect that the beast asked the child: "Tell me, don't you think me very ugly?" And Beauty, who could not do otherwise than speak the truth, replied: "Yes, poor Beast; but you are so very good and kind." And then, to that rejoinder, came a terrifying question: "Beauty, will you marry me?" But Beauty, though greatly frightened, answered, in a very firm voice: "No, dear Beast." And yet we all knew that she did marry him; but that was the sequel to the story, which he must not yet consider. We closed the book of fairy lore, and we looked back into the far historic past. We saw people in the dim darkness with outstretched arms, groping as if seeking to touch the hem of His garment who came as the King's son, but satisfying their desire by making rude images of the unseen gods. Two rude pillars of stone would very well represent Castor and Pollux, and a slab across united both. But were these the first objects worshipped? No. Wherever we were able to trace the earliest forms of worship, we found the tendency was to pay devotions to natural objects, such as the sun, moon, and stars. Then came the manufacture of rude gods, then hero worship, the deities being invested with human passions and characters. This was the history of the pantheon of all religions. Two blocks of stone were all very well at first, and Homer could worship them; but when he came to sing of Helen he found he must give her all the charms of womanhood, and these beauties were shown in painting and in sculpture. We had a long procession of poets from Homer down to Virgil, who endeavoured to fashion for themselves a standard of beauty, or to express their sense of the loveliness of the natural world. The worship and ritual of Classic Rome were, the lecturer contended, intellectual in a high degree, and the geometry of Euclid of Alexandria was that still taught in all our public schools. The effect of all these, and of the development of sculpture and painting, was to raise art and set it on a throne of greatness the like of which had never since been seen. At no other period did men so clearly perceive that Art was the King's son. This was the first vision of Beauty by the Beast. To return to the fairy story, they would remember that Beauty had, we were told, the tenderest heart in the world, and that her fear of the beast grew less, until he alarmed her more than ever by asking, "Will you marry me?" And still, frightened as she was, she firmly replied, "No, dear Beast; but I shall always be your friend, and let that content you." The poor beast could make no answer, but only sigh. And well he might, for her vision was fast becoming more dear to him. And so, turning from the fairy story to the pages of history, we saw how Virgil sang of the beauties of nature, and then how the darkness grew deeper, the Laocöon sculptures being among the latest evidences that men understood something of beauty before they were again groping in the night. Then came a thousand years of darkness to the painter and sculptor, a thousand years whose story had little to do with art. But on the tenth night after the last conversation with the beast, we were told in the story, Beauty dreamed that she was in the garden of the palace, and she fancied that the beast lay there dying. The legend was so extremely true, that it was difficult to disentangle the facts of history from the myth. After the ten nights of dark and sullen centuries had passed away since the decay of art, the love of the beautiful was, in reality, very nearly dead. Then came the revival in the years of the 13th century, when there arose Cimabue, Giotto, Gaddi, and Orcagna, and a few others, who began to essay painting. When we saw Italian frescoes more coarse, perhaps, than beautiful, let them remind us of these men who lived nearly as long before Raphael, as we lived after his day. Had not Cimabue and Giotto, and the rest of those 13th-century pioneers, laboured to display their art, the wonderful paintings of Raphael and Michael Angelo would never have been executed. And these later men were not masters of one art only, but were at once painters, architects, and sculptors. The development of the old fairy story was the foreshadowing of this revival of the arts. We saw, as we were told in the legend, how, as Beauty went forward, the night passed away as she reached the gates of the palace garden. The doors rolled back at her approach, she passed down the long avenue, and the palace of the beast had become the temple of the great king. For the second time, they had that evening seen what was the King's message to mankind, as interpreted by successive races. The artists of the Classic Greek period and of the Mediæval ages differed from each other as widely as the poles in the treatment of human life. The Classic artist took the human form as the exponent of all he had to express, and showed it in its highest beauty and perfection; but of the emotions within and life beyond that body he told us nothing. Sorrow: why should it, the Greek artist asked, find expression in human art? Pain and suffering were equally repulsive to him, and thus suffering, pain, and sorrow were alike expelled from the range of his art; but at what a cost! There could be no passion without sorrow, no deep sympathy without suffering, no test of human endurance without pain, so that where these three—pain, sorrow, and suffering—were excluded, art was, at the same time, deprived of the exposition of the noblest emotions of which human nature was capable. But the Greek artists strove to represent their power over form as pictured on Mount Olympus, where the gods lived and where the air was always clear, as the storm clouds burst far below. But on the other hand, the face of the Mediæval artist was set towards another Mount, where he saw the suffering and tried King's messenger coming down into the midst of human woe. It was as though the Greek artist had seen the glory of the messenger, but listened not to his message, whereas the Mediæval artist, while pondering over the message, failed to perceive the divine splendour of the messenger. Mr. Bayliss said he had not forgotten that he was addressing the members of the Society of Architects—indeed, it was for that very reason that he had cast his story into the form it had taken. He wished to speak as an artist to artists, and to come to first principles. It was not the business of those he was addressing to lay paint on canvas, nor was it his business to direct the erection of buildings; but it was the common business of them all to understand what they meant by their art. It was Art which was the main point of union between them as architects and painters, and it was that only which justified him in speaking to them that evening. He regarded art as all-embracing, as including not only painting, sculpture, and architecture, but also the finest dramatic literature of the ancients, the myths of the sun-gods, and the romantic legends of the Renaissance. He sought to direct attention to the grounds on which he based his hope that there was a great future for art if only it were true to its purpose, not by the revival or institution of past achievements, but by becoming the expression and incarnation of an advancing race. The lecturer recited the graphic description of the worship of Adonis from a fragment of Theocritus, and then narrated the treacherous murder of Balder the Beautiful by the mistletoe thrown by the blind Hedda, and showed that both these myths, from widely separated countries, and belonging to different eras, referred to the death of the sun at the approach of winter. Having referred to the development of Gothic architecture as the first phase of the revival of art after the Dark Ages, the lecturer urged that the hope of modern art lay in a return to a study of nature, and closed his address by remarking that if Art was the King's messenger, she must, and would, show the mastery of Evil by the ultimate triumph of right. The old fairy legend, as they would remember, ended with Beauty's declaration, "No, dear Beast, you shall not die, but live; I thought my feeling for you was only friendship, but now I find it was love." That was the message she delivered, and then Beauty covered her eyes and wept. When she again looked up the Beast was gone; yes, he had become revealed as the King's son!

A hearty vote of thanks was accorded by acclamation to the lecturer on the motion of Professor Henry Adams, seconded by the Rev. Philip S. O'Brien, D.D., and the members and friends dispersed to examine the water colours and oils on the walls of the galleries.

BACK-TO-BACK HOUSES AT LEEDS.

WE have before referred to the number of towns—happily fewer than formerly—in which back-to-back houses are allowed to be erected. A very instructive article on the question of "Back-to-Back v. Through Houses" appears in the *Leeds Mercury*. The reply to the question addressed to responsible officials of a number of

important towns as to whether back-to-back houses are allowed to be built is in a large number of cases in the negative. The exceptions are few, though in these towns the examples are chiefly old, except at Plymouth, Portsmouth, and a few other boroughs where this mode of building is permitted. Bradford, Halifax, Huddersfield, and Leeds permit this pernicious and insanitary mode of building. In the first of these towns Bradford, back-to-back houses are built in blocks of four, with a common yard at the rear of 720sq.ft., and this yard is approached by a covered passage 6ft. 6in. wide. Thus each house has ventilation from the side as well as the front. The building committee has a discretionary power in the matter, though seldom taken advantage of. Again, in Huddersfield, the Special Commissioner says, "all the back-to-back houses now built have a passage leading from the street into the yard of not less than 3ft. 6in. wide." The same state of things is allowed in Halifax. The writer goes on to say that out of 28 large towns 20 absolutely prohibit this system of building; in another the question has never arisen, in two others the plan has been adopted in a few cases.

Referring to Leeds, "the building laws permit the erection of back-to-back houses in blocks of eight with an intervening space of 15ft., in which the conveniences are erected, or in a continuous row, provided that each house has its own water-closet." There is thus no side ventilation in Leeds, and the circulation of air is less than in the blocks on this plan in Bradford and Huddersfield. The writer, in fact, points out the exceedingly insanitary condition of Leeds in this respect. Of course, much of this class of building is to be attributed to the rents of houses of the back-to-back and "through" kind. Several answers have been given by this correspondent to questions on this point. These refer to new "through" houses. The rents given, including rates, vary from 3s. per week in Hull and Nottingham to 5s. or more in Bradford, Huddersfield, and other places—for example, at Brighton, the rent is 6s. to 7s., including rates; at Birkenhead it is 4s. 6d. with four rooms; at Birmingham 4s., including kitchen, scullery, sitting room, and two or three bed rooms; at Blackburn, 3s. 6d., four rooms, with yard, &c.; at Bolton, 4s., kitchen and scullery, and two bedrooms; at Bradford, 5s. 9d., including living room and scullery, two bedrooms, and attic; at Derby, 4s., kitchen, scullery, two bedrooms; Halifax, 4s.; Manchester, 4s. 6d. to 6s.; at Liverpool, 5s. to 5s. 6d., with about four rooms. Indeed, Mr. Gordon Smith, architect to the Local Government Board, and Dr. Barry, one of the inspectors of that body, have reported that, in carefully-prepared plans and estimates of a back-to-back house and a through house, affording practically the same accommodation, and complying in each case with the local by-laws, both at Halifax, the estimated cost of construction was £156 12s. 8d. for the through house, and £152 1s. 8d. for the back-to-back house, a difference in favour of the latter of £4 11s. only. The question is asked, What becomes of the contention that the working classes of Leeds must be housed in back-to-back dwellings? With one or two exceptions, the "through" houses are as cheap as those of the back-to-back system. No doubt they are, but the latter principle is a little more saving in area. But so trifling is this difference, that the municipal authorities, ought to place health first, and set an example worthy of so important a town by abolishing a system of building agreed on all hands to be injurious.

ROBERT BOYLE AND SON, LIMITED.

THE annual general meeting of this company was held at the City Terminus Hotel on the 25th ult., when a dividend of 12½ per cent. was declared on the ordinary and deferred shares, one-sixth of the profits being placed to the reserve fund, and a balance of £266 11s. 5d. carried forward to next year.

Mr. Robert Boyle, chairman and managing director, in moving the adoption of the report and accounts, which were unanimously adopted, said: No efforts have been spared to bring the business of the company into its present prosperous condition, the year ended having been the most profitable since the formation of the company, notwithstanding the great strike in the building trade, which has now existed for over six months, and the almost unprecedentedly severe weather experienced during the whole year, which naturally might have been expected to affect the demand for ventilating appliances, as in very cold and inclement weather the necessity for ventilation is neither so evident nor desirable as in warm weather. You are all doubtless aware of the discreditable practices of a certain ventilating company, which, by underhand means, surreptitiously acquired a knowledge of the details of plans and estimates furnished by us for the ventilation of certain buildings, and the dishonourable way in which this information was utilised by duplicating and sending in the same uninvited to our clients, but substituting a ventilator made to imitate the external appearance of the air-pump ventilator, and tendering at a lower price. We have received a large number of letters from architects and others expressing their disgust at the contemptible conduct of the ventilating company in question, and many of you may have read the scathing criticisms of the Press, unanimously referring to the matter as "the most unscrupulous and discreditable affair ever heard of in connection with business." We do not object to honest competition—there is room for it; but these are the sort of tactics we have had to contend with in more quarters than one for a considerable time back. But, from the steady increase in our business each succeeding year, architects are evidently not to be so easily imposed upon by these enterprising individuals, and are quite alive to the fact that certain things, though speciously offered at a low figure, may be dear at any price. Such unprincipled practices, when introduced into business, and which, from the low moral standard of the authors, they generally deem to be the climax of cleverness, invariably end, sooner or later, in their ignominious collapse, and of those who have aided and abetted them. When the proper time arrives for the full exposure of these disreputable proceedings, revelations will be made with respect to the connection of certain persons with the ventilating company implicated, which I feel sure will come as a surprise to many here, for I regret to say that we rank amongst our own shareholders those who, for private ends of their own, which, I think I need hardly say, are chiefly of a pecuniary character, have made, and are still making, determined, though futile, efforts to injure the business of the company. As you are aware, I have from time to time effected improvements in the air-pump ventilator, adding considerably to its value as a foul-air exhaust. I am now completing my final tests with the latest improvements, which, I believe, will bring the air-pump ventilator to as near perfection as it is possible for an automatic ventilator to attain. The present form of air-pump ventilator is made of an ornamental character, with the best rolled steel plates, galvanised, and painted with enamel paint; and though in every way superior to the forms previously made, is now sold at about 50 per cent. less in price. Though this, of course, has reduced our profit on each ventilator to a minimum, the remarkable increase in the sales which has resulted has, I think, fully justified the reduction made. I am glad to say that the foreign agencies continue to be satisfactory, our system of ventilation being successfully applied to an ever-increasing number of leading public buildings in Germany, France, Russia, Belgium, Italy, Spain, Holland, Denmark, Norway, and Sweden, also America and Australia. My visit last year to Egypt, India, China, and Japan has also been productive of good results; and the hopeful anticipations I expressed at our last meeting regarding my proposed visit to South Africa have been, I am pleased to say, more than realised, I having, during that visit, established agencies in Cape Colony, Natal, the Transvaal, and the Orange Free State, stocks of ventilators amounting to the value in South Africa of over £4,000 having been bought and paid for; whilst our system of ventilation has been applied to, and adopted for—amongst a large number of other public buildings in South Africa—the Houses of Parliament, the Castle, and Town-hall, Cape Town; the High Court House, new Government buildings, and new Stock Exchange, Kimberley; the new Stock Exchange, Theatre, and Pavilion, Johannesburg; the New Club, Court House, and Hospital, Pretoria; the Houses of Parliament, new Town-hall, Municipal Buildings, and new Railway Station, Pietermaritzburg; the Town-hall, Municipal Buildings, and new Railway Station, Durban; the Cathedral, Grahamstown; new Theatre and Opera-house, the drainage system, Port Elizabeth, &c.

The directors and auditors having been elected, they and a number of shareholders referred in highly complimentary terms to able manner in which Mr. Boyle had managed the affairs of the company, and the proceedings terminated with unanimous votes of thanks to the chairman and directors.

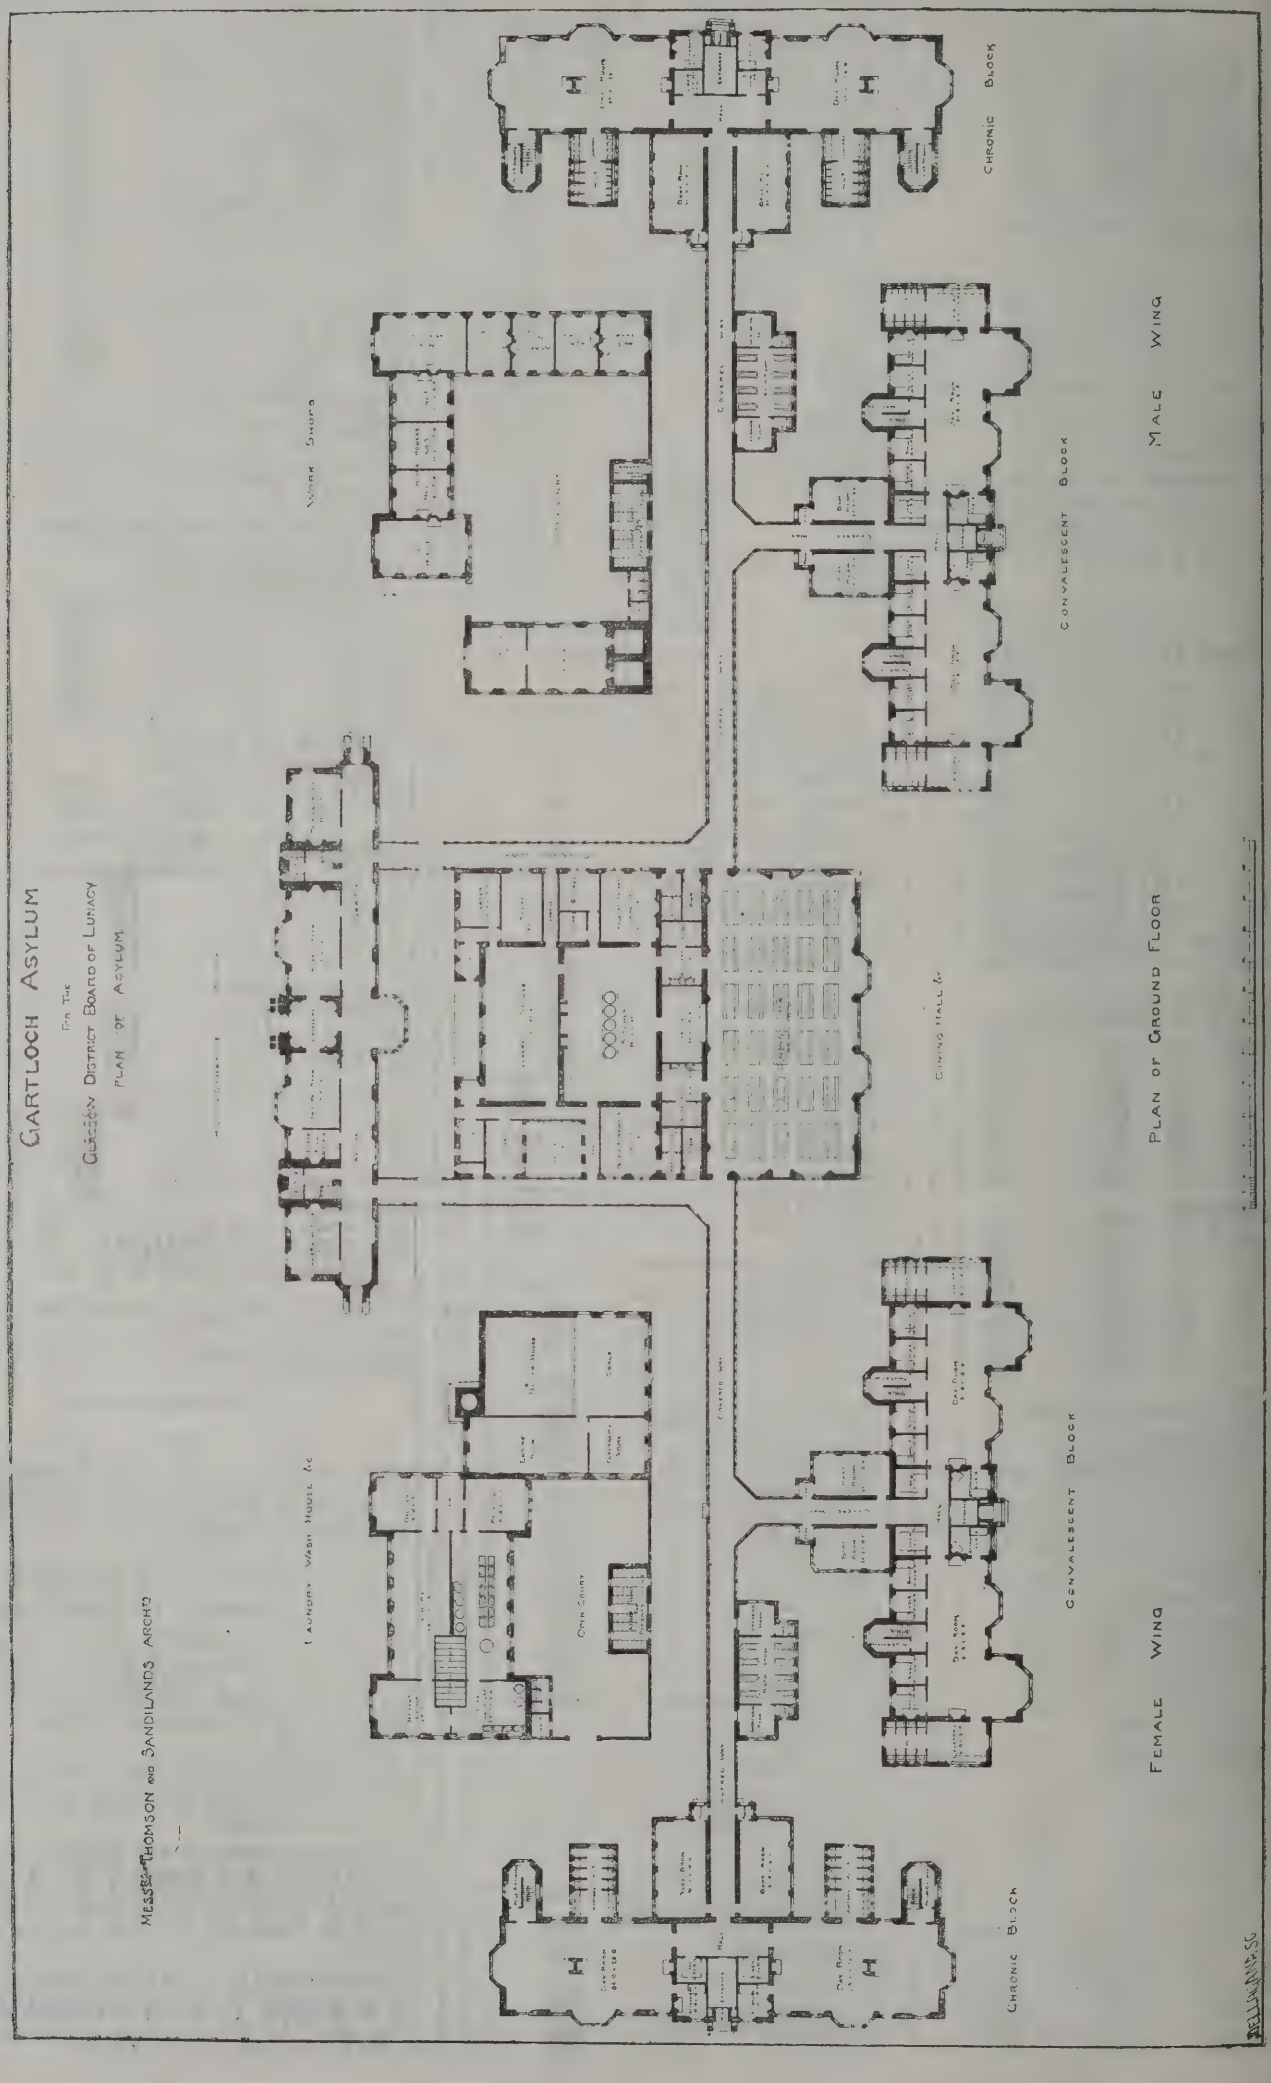
CHIPS.



The salary of Mr. Francis J. C. May, C.E., borough surveyor of Brighton, has been increased from £500 to £700 per annum. The vote was unanimous, and the speeches of the members of the town council most complimentary.

A mission hall in Ellis-street, Birmingham, built by the congregation of the church of St. Thomas was opened on Saturday. The building comprises the hall, which will seat between 350 and 400 people, two entrance porches, classroom or vestry, kitchen, store-room for chairs, heating chamber, &c. The cost, including furniture, &c., has been about £1,300. The architect is Mr. F. B. Osborn, and the builders Messrs. Hopkins and Son, of Birmingham.

The Staffordshire County Council has under consideration the choice of a site for the proposed new county lunatic asylum, to be built at a probable cost of about £100,000.

The annual meeting of Ayr Guildry Court was held on Friday, when Captain Girvan, Master of Works, was unanimously elected Dean of Guild. Mr. A. G. Young was chosen clerk, and Mr. R. M'Callum treasurer. Ten new members were elected.

Under the will of the late Mr. James Middlemore, the corporation of Birmingham is bequeathed for the Municipal Art Gallery two oil-paintings—"Le Soir," by Charles Gleyre, and a copy of Guido Reni's widely-known "Aurora."

FIRST PREMIATED DESIGN FOR THE NEW BATTERSEA TOWN HALL.—THE HAMPSTEAD SYNAGOGUE.—NORTH SIDE OF NAVE, HALBERSTADT CATHEDRAL.—HOUSE NEAR SALISBURY.—SIX COTTAGES AT ELSTREE.—ST. MARGARET'S CHURCH, BLACKWOOD.—GARTLOCK ASYLUM, GLASGOW.

Our Illustrations.

BATTERSEA TOWN HALL.

Mr. E. W. Mountford's selected design for the new Battersea Town Hall, which we illustrate to-day, will be found fully described in our review of the competition, which appears elsewhere.

THE HAMPSTEAD SYNAGOGUE.

The Hampstead Synagogue will be distinguished by several departures from traditional details. In place of the familiar oblong, its form will be octagonal, and this form will insure an equally good view of the ceremonial from all parts of the building. The reading-platform, instead of being in the centre of the building, will adjoin the ark-platform, and will be approached on either side by staircases in the form of a quarter circle. The pulpit will spring from the ark-platform, and the reading-desk will be arranged so that the reader may either face the ark or face the congregation, as the occasion may require. The ark itself will have the character of a miniature temple, surmounted by an enriched dome. The choir will be placed behind the ark, and the voices will enter the synagogue through wrought-iron grilles in the apse. The reading-platform and the ark-platform being raised considerably above the level of the synagogue, removes the necessity of placing the gentlemen's seats in tiers; while the entire centre of the ground floor is covered with cross-benches. The gallery is arranged in tiers, and the tiers are so pitched as to allow of each lady having an uninterrupted view of the service. Spacious gangways are provided both on the ground floor and the galleries. The entrance-hall leads right and left through vestibules to the grand staircases, which are inclosed in separate buildings. In addition to the grand staircases, there are two emergency staircases, so that there are four distinct means of exit from the gallery. The ground-floor has five distinct exits, and the plan has been so arranged that on reaching the foot of the gallery stairs, ladies may at once pass out into the street without meeting the crush in the vestibules. Behind the staircases are the gentlemen's cloak-rooms, and at the gallery level are extensive cloak-rooms for ladies. The entrances from the vestibules and the staircases into the main building are effected through lobbies, each lobby being fitted with two sets of double-swing doors, this arrangement being devised to prevent the draught and noise caused by the opening of single doors. The flaps of all seats are fitted with indiarubber borders, to prevent noise from slamming, and all the seats are upholstered and separated by arms. The lighting of the building is effected by a sunburner of great power, and by gas standards. The heating is effected by a hot-water system, the pipes being hidden in trenches, and the warmth being introduced through gratings. The ventilation is obtained by fresh-air inlets, and by extract cowls. Special extractors are provided to draw the vitiated air from under the gallery, and a powerful cowl surmounts the chimney of the sunlight. The gallery is supported by columns at the angles of the octagon, and these are carried up to the springing of the roof and support the steel ribs which form the dome. The building has been designed on Romanesque lines, the leading characteristics of the façade being the great central tower flanked by the towers containing the staircases. The design depends largely for its effect upon the grouping of these leading features, and in the exterior as well as in the interior the conventional form of the synagogue has been as far as possible avoided. The elevation will be executed in red bricks and red stone of a rich colour, and the interior will be finished a pure white, with dark oak joinery. The architect of the building is Mr. Delissa Joseph, F.R.I.B.A., of 17 and 18, Basinghall-street, E.C. The contract has been awarded to Messrs. John Allen and Sons.

HALBERSTADT CATHEDRAL BUTTRESS FROM NAVE.

Halberstadt is one of the oldest towns in Germany, and was of sufficient importance in the ninth century to give title to an episcopal see. Its prosperity has long since departed; but the great variety of buildings, of all styles, from Romanesque to Renaissance, affords free scope for the exercise of the artist's pencil. The cathedral of St. Stephen, built on the site of an older church destroyed by fire in 1181, is in itself a marked instance of the change and progress of Mediæval architecture. The west towers are Romanesque, while backward towards the choir is to be seen the full development into Decorated Gothic. The portion of nave shown in drawing was sketched as exhibiting a fine example of design in buttresses. H. H. McC.

HOUSE NEAR SALISBURY.

Messrs. Crickmay and Son, of 17, Parliament-street, S.W., are the architects of this house, but no further particulars have reached us.

COTTAGES AT ELSTREE.

These two groups of labourers' cottages were built last year for Mr. H. H. Gibbs, M.P., on the northern slope of Elstree Hill, from the designs of Messrs. Woodd and Ainslie, of 35, New Bond-street, London, W. Each group consists of three cottages, containing three bedrooms, living room, scullery or wash-house, and the usual offices and stores. The materials used are red brick with moulded Costessey brick window-dressings for the lower parts, brindled tiles for the roofs and tile-hung portions of the upper stories, and oak half-timber work for the gables towards the road. Messrs. Shillitoe and Son, of Bury St. Edmund's, were the contractors.

CHANCEL DETAILS, ST. MARGARET'S CHURCH, BLACKWOOD, NEWPORT, MON.

This sheet of working drawings needs but little explanation, as the details explain themselves. The pulpit, screen to the organ transept, and the choir stalls, &c., are all made in oak left untouched from the joiner's hands. The carved bosses were very nicely executed by a Hereford man, and are varied in design, and all cut out of the solid. The roof of the building is stained green and varnished. The walls are finished a salmon-red, with a rich Persian red dado, and the slopes between the rafters and purlins are coloured a warm cream. The dwarf wall at the entrance of the chancel is for the intended rood screen. The altar rail of oak has wrought-iron and copper standards, like the detail shown on the sheet. The vestry door and other woodwork not of oak is stained red and varnished. The walls are of stone from the quarry at the rear of the churchyard, given by Lord Tredegar. The nave of the church was erected some years ago from the designs of the late Mr. Bowes A. Paice, A.R.I.B.A. The builder of the present completion work was Mr. Hy. Welsh, of Hereford. Mr. Maurice B. Adams, F.R.I.B.A., was the architect.

GARTLOCH ASYLUM.

(For description see page 844.)

It has been decided to place a monument in Carlisle Cathedral, as a memorial of the late bishop, Dr. Harvey Goodwin.

RAILWAY RATES FOR TIMBE CARRIAGE.

An important meeting was held at the L Chamber of Commerce on Thursday i week, for the purpose of considering the qu of railway rates as defined by the various which became law last session, and as af by other Bills which will come under the sideration of Parliament in the forthc session. Mr. Wade, of Hull, moved a re tion, which was seconded by Mr. Ald. Lo Bristol, and after considerable discussio several amendments had been submitted following was put by the chairman: "with a view to a fair and equitable settlem the railway rates question as regards the ca of timber, it is desirable—(*a*) To organise a sentative deputation to the Board of Tra support of the general objections of the tr machine weight, so far as regards Bills brought forward next session. (*b*) To pe against the North-Eastern and other rema railway Bills which are to be introduced next session, in so far as the objections timber trade are not met. (*c*) To fram draft a short Bill repealing the objectio conditions passed in the various railway B the last session of Parliament, in order to the following results: (1) That, with rega the foreign timber trade, deals, battens, b and sleepers, being of regular and ascer sizes, easily computed, shall be carried by puted measurement weight only, and in C instead of Class I. (2) That all balk ti both square and round, whether forei English, shall be carried at measurement and in Class C, computed as at present, sa except pitwood timber, and also such ki timber as are by custom of the market, b and sold by weight." Three members against the resolution, and on a show of ha its favour the chairman declared the reso carried by a very large majority.

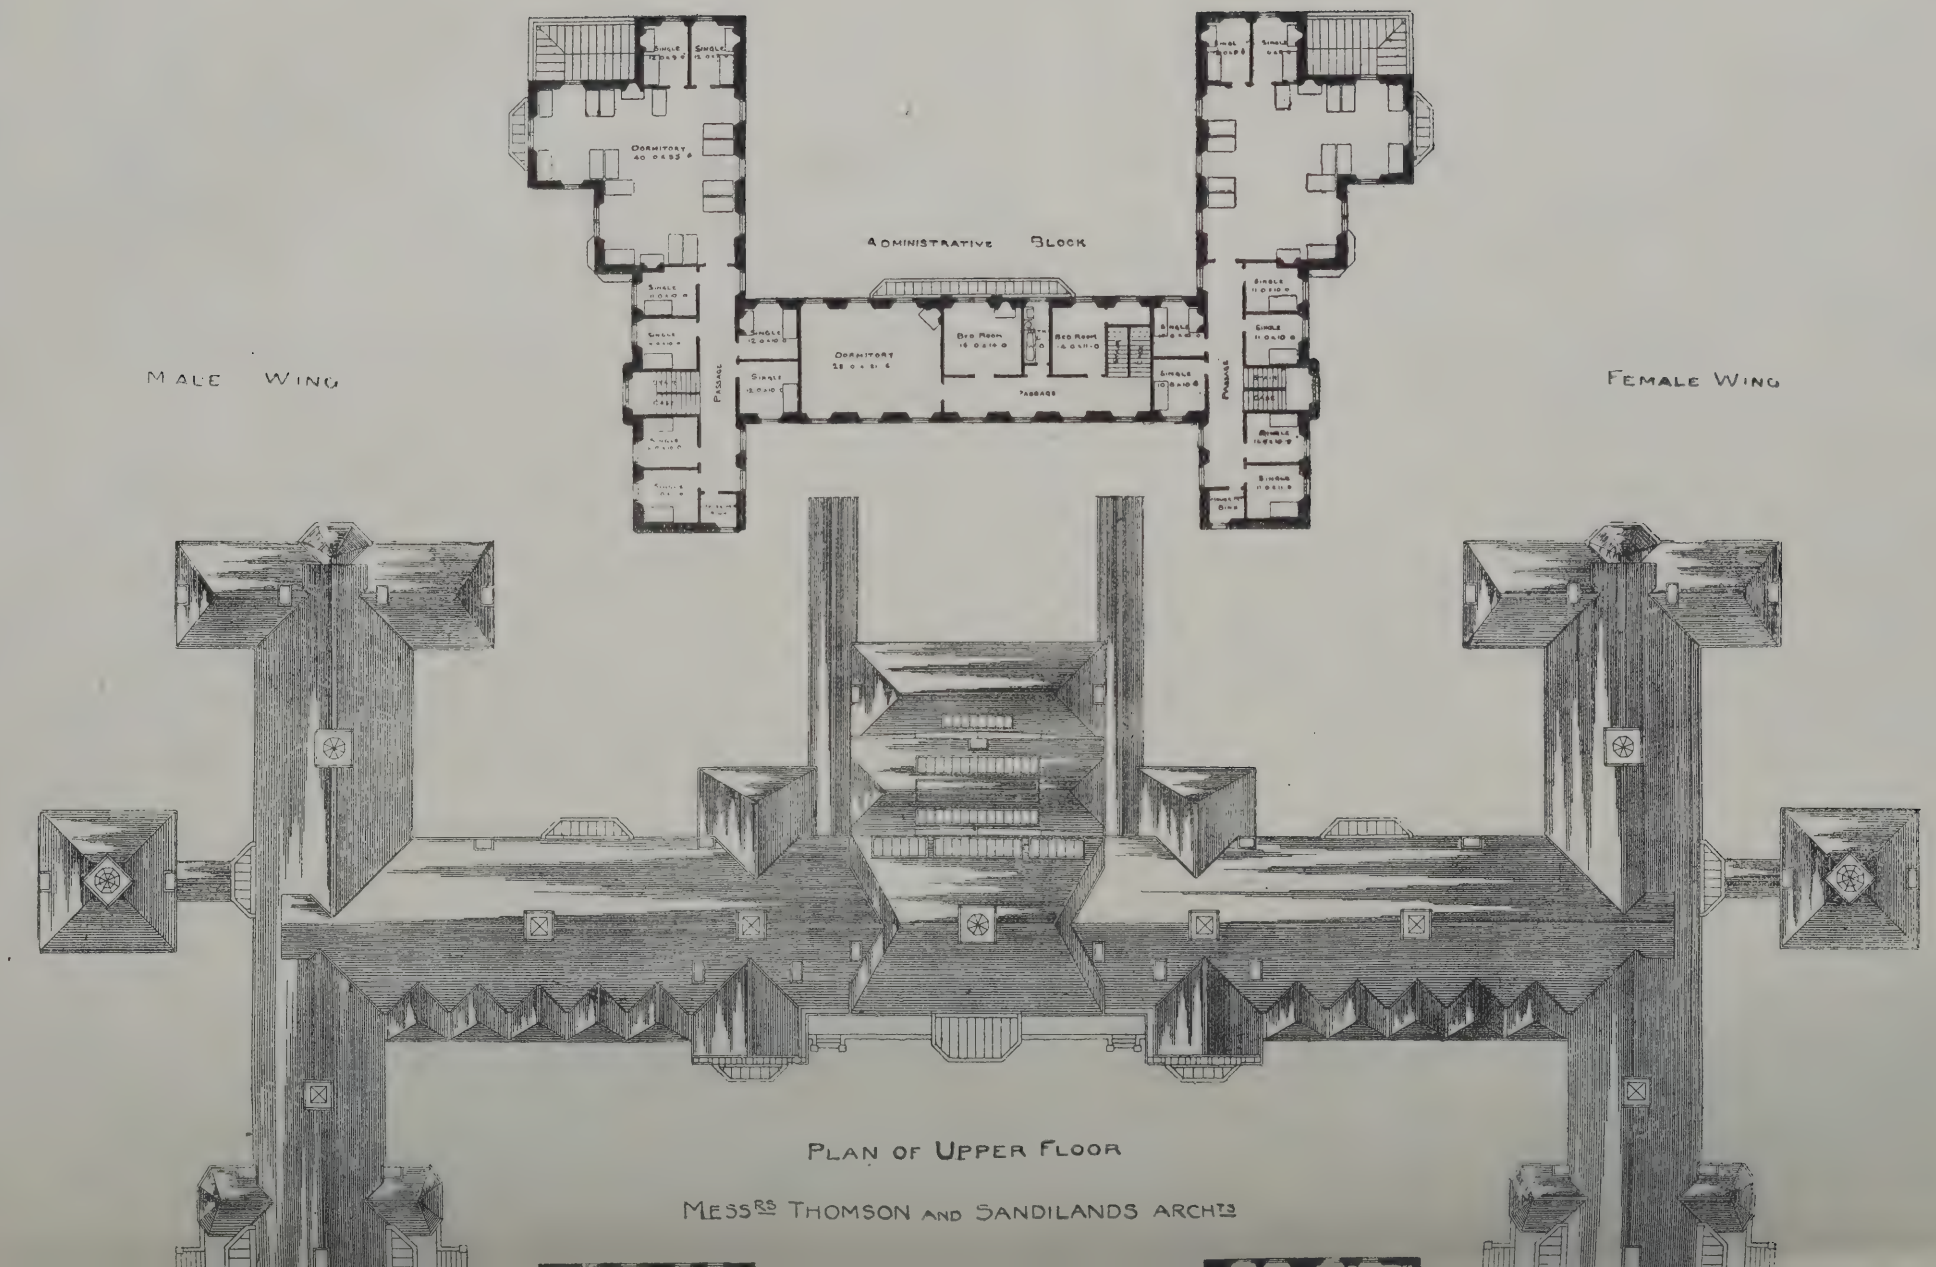
CHIPS.

The Local Government Board have give assent to the application of the Croydon C Council for permission to expend the s £70,000 in the erection of new municipal ings. The work will be taken in hand immediately.

The addition to the Nurses' Home at the W Infirmary, Glasgow, which has been extende to accommodate the whole nursing staff, was on Friday. The extension consists of three which contain forty-seven additional room the cost, including furnishing, amounts to £10,000.

The Lynn town council have decided to gas buoys for lighting their channel throu Wash. The capital expenditure is estima £4,994, and the cost of maintenance at £7 annum.

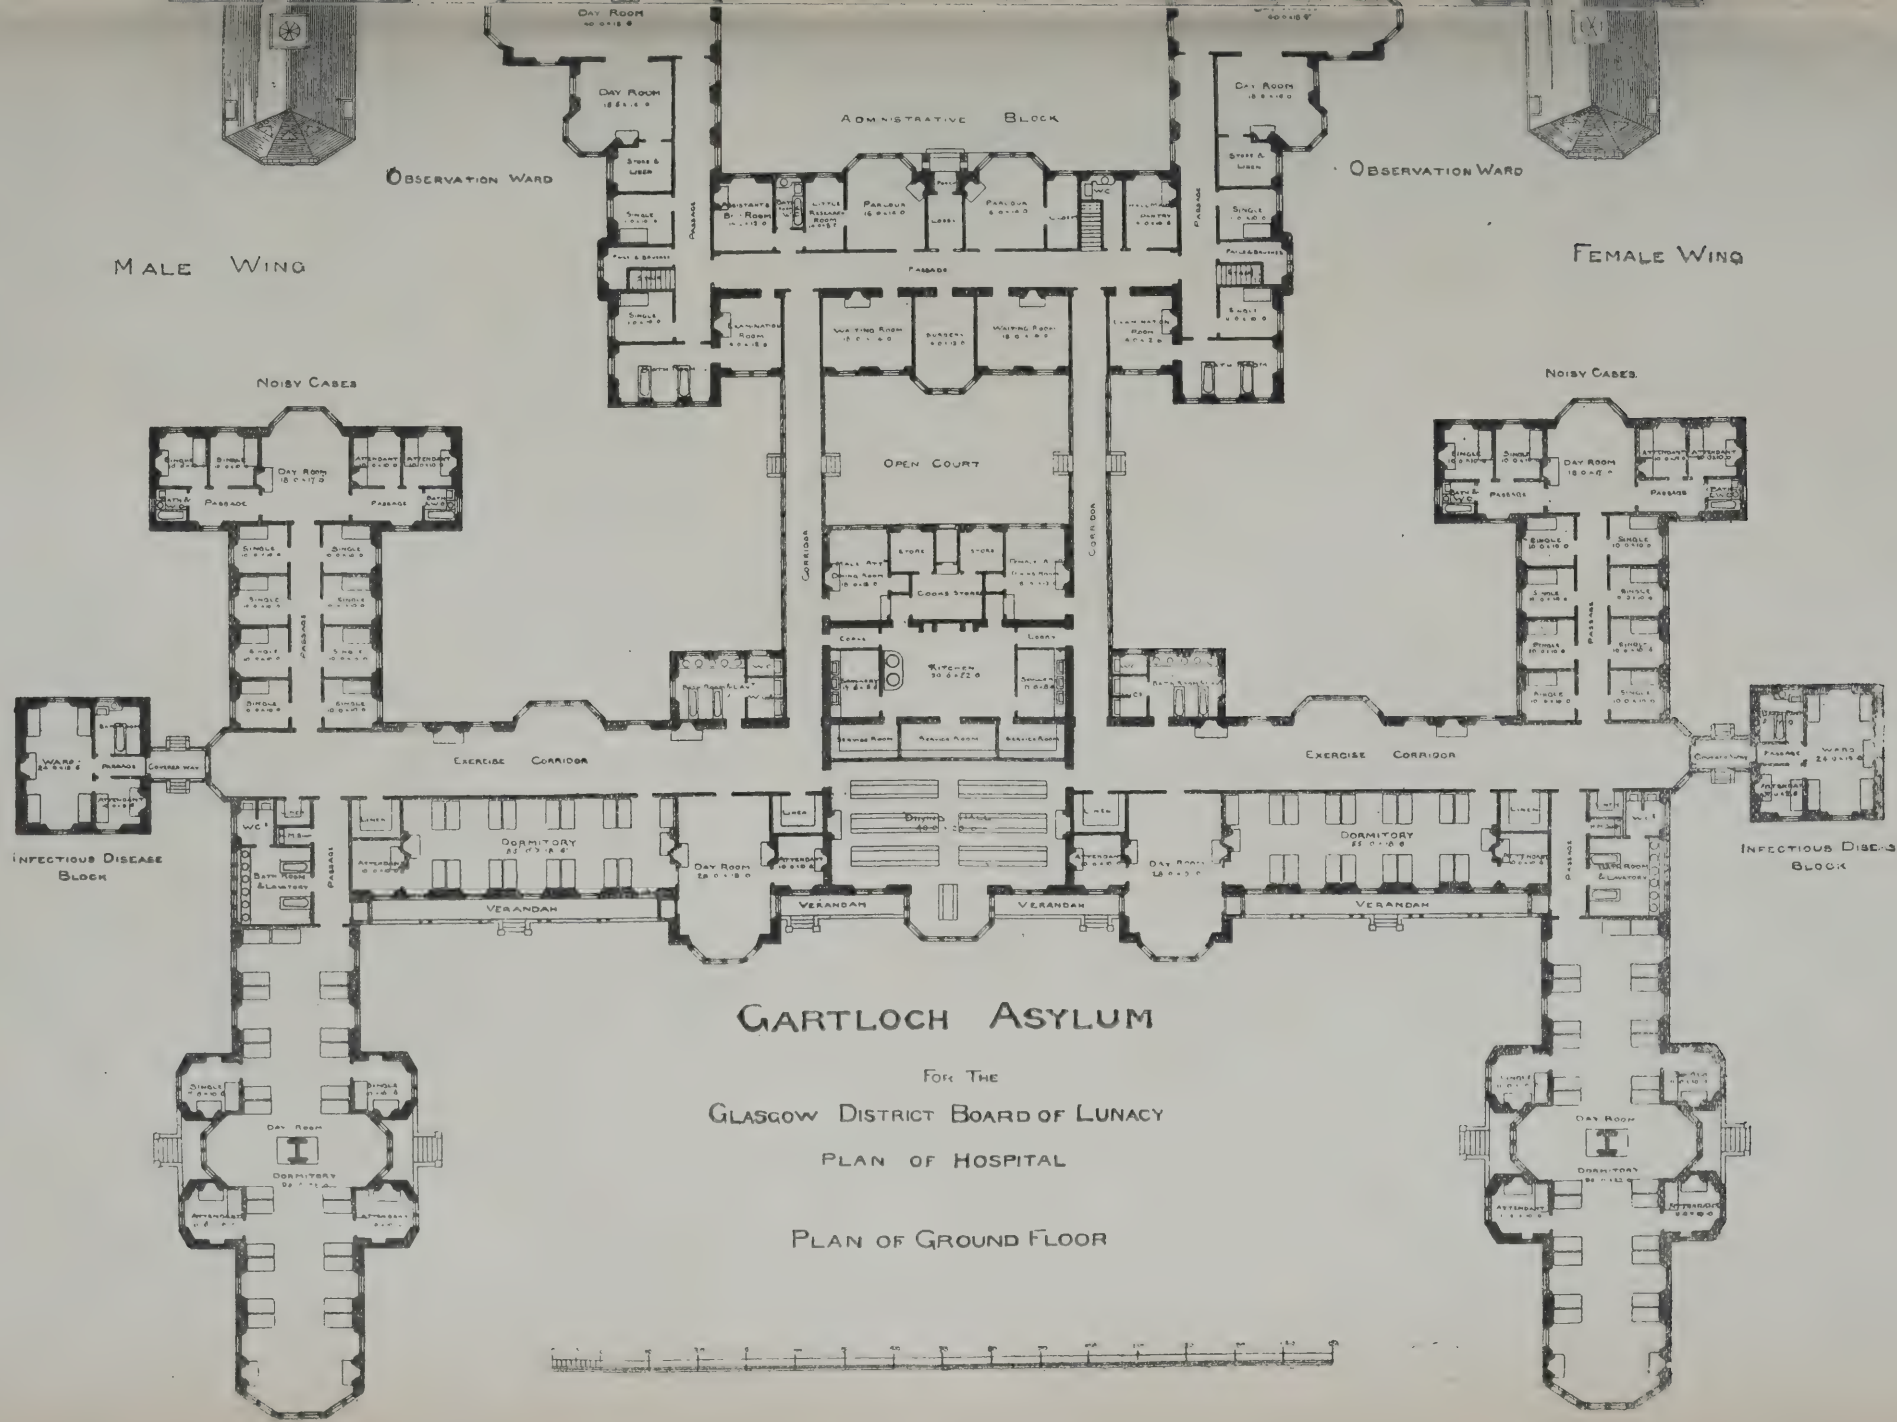
Sir Henry W. Peek, Bart., officiated on afternoon at the opening of the new premi the London and South-Western Railway Se Orphanage, Jeffreys-road, Clapham-road.



The Wesleyans at Eastwood, Keighley, ha erected, adjoining Victoria Park, a new chapel in place of the old premises, sold Midland Railway Company for £1,750. Th structure will accommodate about 400 chil the lower room, and in the upper room 426 in pews, and 150 more on the platform an benches. The contracts, which has been carr under the supervision of Messrs. W. and Bailey, architects, Bradford and Keighley involved an outlay of £3,300.

Mr. William Morris has been appointed of the Art Workers' Guild, in succession W. B. Richmond, A.R.A.

Mrs. J. T. Hibbert has intimated her in of building a church at Field Broughton, G over-Sands, at a cost of £3,000. She will al the site.



The second of a series of free fortnightly l under the auspices of the Glasgow Par Galleries Trust was delivered on Saturday e to a crowded audience in the Corporation Ga Sauchiehall-street, by Mr. James Payton, of the Galleries and Kelvingrove Museum lecture, which was profusely illustrated wi tern views, was descriptive of the Dutch which form part of the corporation fine art tion.

The Liverpool City Council have decid 26 votes to 17, to open to the public on afternoon the permanent collection of pict the Walker Art Gallery.

GARTLOCH ASYLUM.

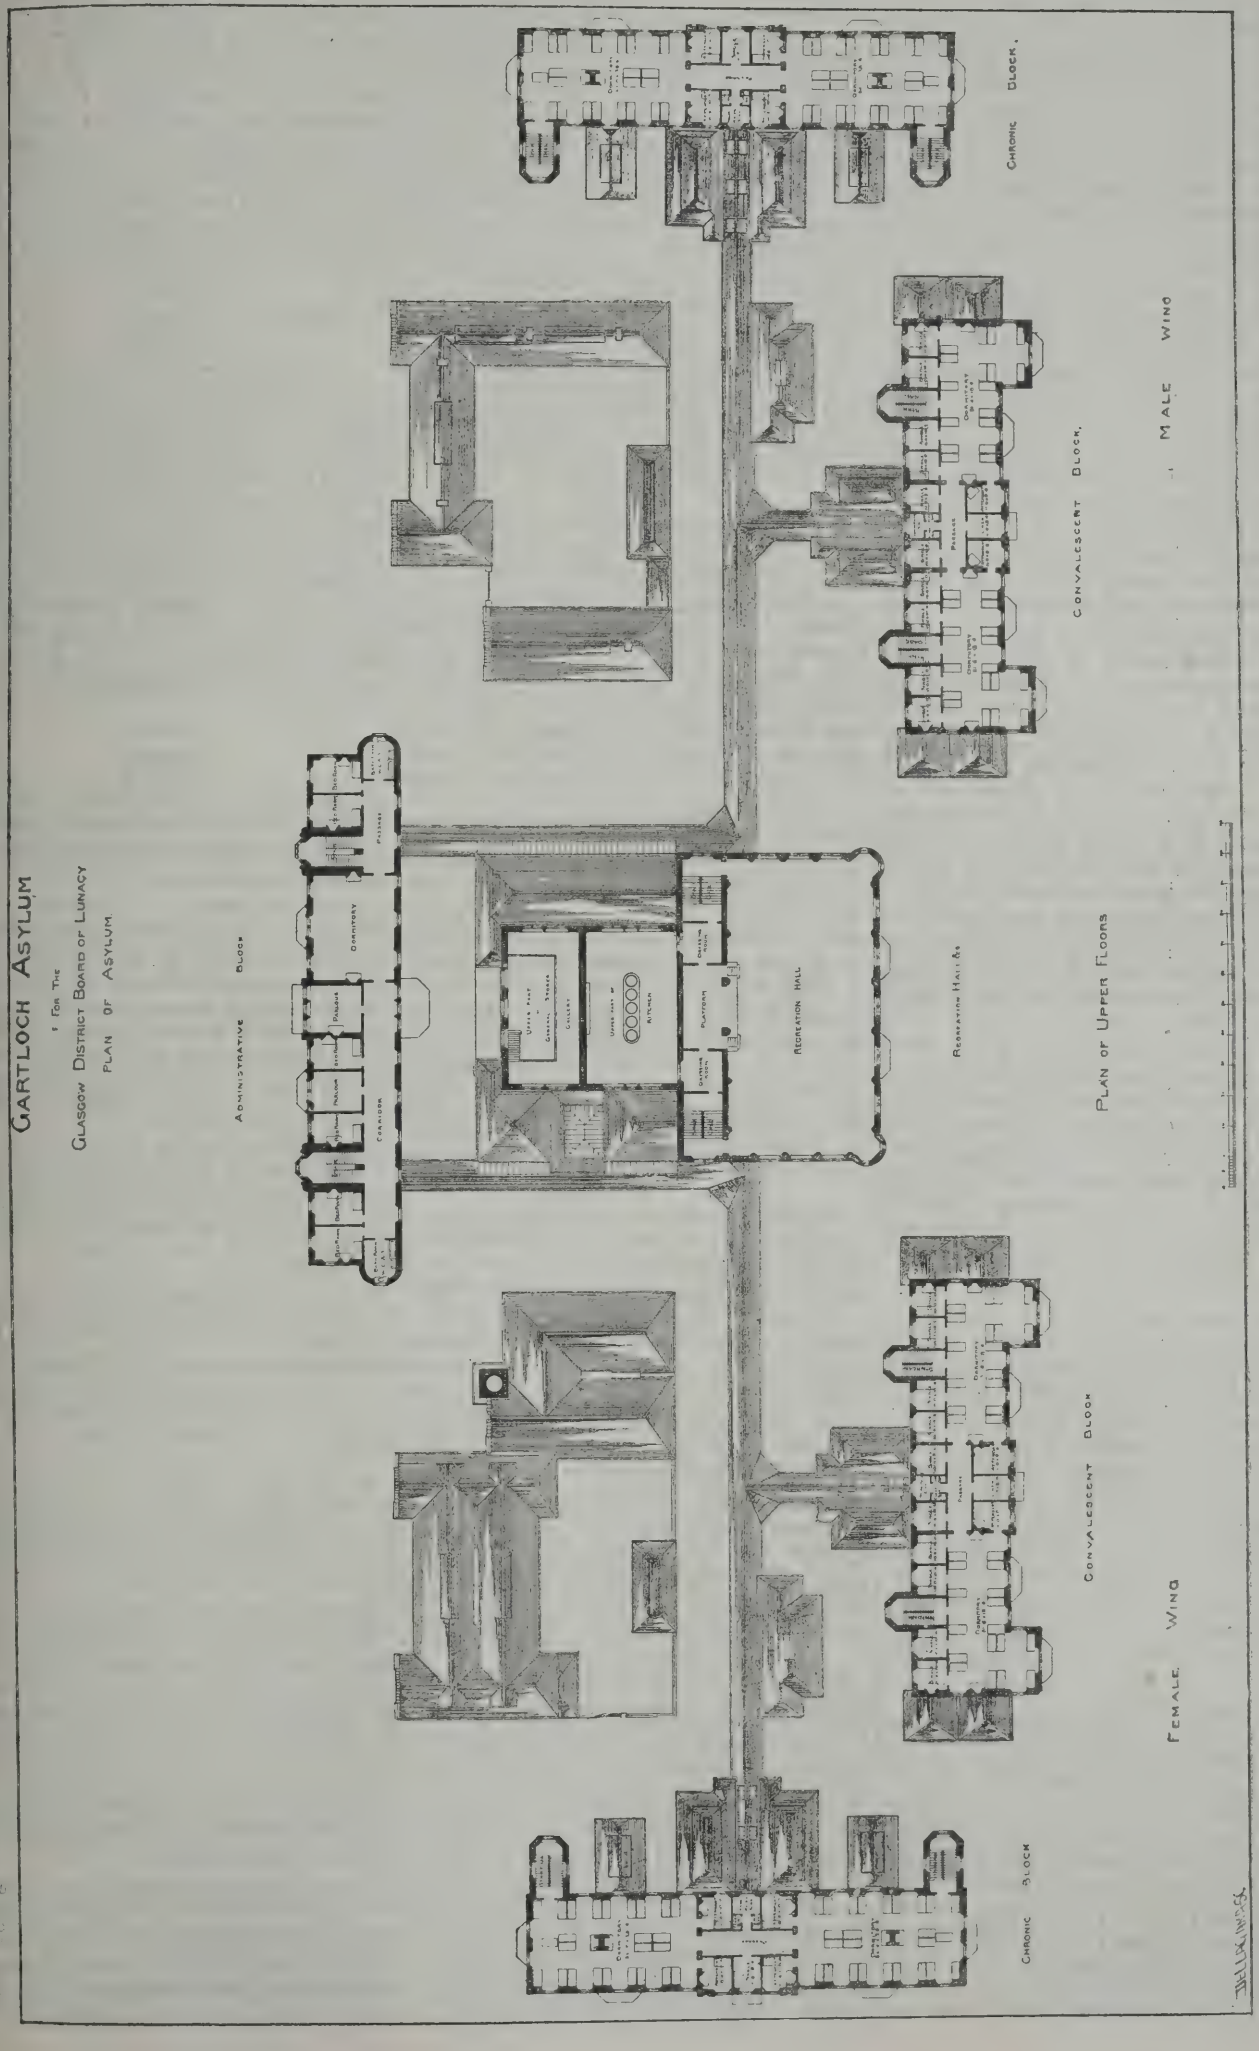
HIS building is now in course of erection for the City of Glasgow District Lunacy Board, the building when finished will accommodate llows:—Asylum: Chronic blocks, 100 male 100 female patients; convalescent blocks, nale and 86 female patients. Hospital: rvation wards, 20 male and 20 female nts; acute wards, 10 male and 10 female nts; fever, &c., wards, 4 male and 4 female nts; day dormitory wards, 26 male and 26 le patients. A large dining-hall is placed in entre of the building, connected to the other of the building by covered ways. Over the g-hall is placed the recreation-room, pro- with stage, and two dressing-rooms entering staircase and opening on to stage. The en is placed immediately behind the dining- and connected to it by a service room ed with hot-plate for carving." Scullery nmodation is also provided, opening into g-hall and kitchen. The kitchen is one , with open-timber roof, lit from above, and ventilated. It is provided with large kitchen e, toaster, and boilers heated by steam. The and female attendants' dining-halls are placed h side, and convenient to the kitchen. These rge, well lighted, and intended to be used by ttendants when off duty as a parlour or ng-room. Immediately behind the kitchen laced the general stores, with cart entrance ack. This is also one story, with large ry, and lit from north side and roof. It is ded to have open-timber roof, and well lated. Around the general stores are several er stores for groceries, bread, soap, &c. To ast and west of general stores are placed the shops and laundry, both of which are pro- with two w.c.'s. The wards in asylum have two staircases each, to serve as escapes se of a sudden alarm of fire. Ample lavatory w.c. accommodation is also provided con- nt to wards, and the bath-rooms are so d as to serve for two wards. Special at- on has been given to the ventilation of rooms, as this is a very important considera- nd too often neglected in such institutions. e first place the boot-rooms are large and To further facilitate the ventilation of rooms, it is proposed that the pigeon-holes oots should be made of wire netting, so as to the air to pass more freely through amongst oots. All doors to single rooms to open out, a few of the rooms to have wood lining, d of plaster for destructive patients. In ses the single rooms have been arranged doors opposite windows, and the beds con- ntly placed relative to windows, so that the from the windows will not shine on the eyes e patient while in bed, and the most ap- d hung shutters to be adopted. All day- are placed on ground floor, and all tories in asylum block are on upper floors. dministrative block in main asylum contains room, doctor's room, clerk's room, male female waiting-rooms, matron, matron's ant, doctor, and steward's parlours and oms, and also a number of spare rooms, and ned to the dining-hall, kitchen, &c., by ed ways. The hospital block is provided dining-hall, kitchen, with store-rooms ed, day-rooms, large exercise corridors, ormitories, and sick dormitories. A small ious disease hospital of four beds is l at each wing of hospital block, attendants' room, bath, and w.c., joined to main block by covered ways. there are no infectious diseases in the n, the infectious disease blocks can be used nection with the hospital. In the other he door to the hospital can be closed, and fectious disease block entered from outside loor provided for that purpose in a covered A verandah is also placed in front of day , facing the south-west, where sick patients e carried to in fine weather. The mortuary ed a little to the north of hospital block the slope of the hill, and screened from by shrubbery. In this situation the mor- is very convenient to the hospital, and also ish road by the east lodge. The day-room tories have been planned to allow of con- t and cheerful sitting space in oriels y patient that may get up during the Linen closets, bath lavatory, and w.c. modation have also been provided. In lministrative block are the matron's room, 's assistants' room, bedrooms, and male and e waiting-rooms. The floor space allowed for each patient is as follows:—Day-room, 30sq.ft. per patient; dormitories, 60sq.ft.; day dormitories, 85sq.ft.; dining-hall, 12ft. All ceilings in wards to be 12ft. high, in day-rooms 13ft. The heating chamber, "agreeable to Government regulations," has been placed outside the building and under ground. The system of heating proposed to be adopted is by large steam boilers, 30ft. by 7ft. From this a 6in. pipe is taken to main asylum, chapel, and hospital block through a built flue under the various floors. This flue will also serve as a shaft for fresh air to supply stores, kitchen, &c., the fresh air being heated in its passage by its connection with the steam pipe. From this 6in. main pipe, 4in. pipe branches will be taken off at each side, and taken through under floors of covered ways to the intersection of bath-rooms. From this point 3in. branches will be taken to each ward to heat hot-water pipes. It is proposed to heat the various rooms by coils placed in the recesses of windows. Each block will have a separate valve for regulating heat, and if anything goes wrong only one block will be cut off. For the ventilation of wards, &c., it is proposed to take in the fresh air under windows. In this way it will pass over the coil, and get heated before being introduced into the rooms. Ventilators will be placed at ceiling for taking off vitiated air, each section having its own ventilator, so that no ventilating flue passes from one section to another, and in this way serve as a conduit in case of fire. Fireplaces are also provided to serve in the event of anything going wrong with steam boiler, and those to be fitted with Shorland's patent improved Manchester grates, with fresh air-pipes, the fresh air passing by the back of the grate and being heated, and passing into rooms by perforated holes in grate for the purpose. The fresh air, of course, will only be introduced in this way when the grates are being used instead of the heating pipes. The elevations have been treated in a simple and inexpensive style suitable for an institution of this kind. The cost of these buildings when finished, including doctor's house, chapel, farm-buildings, mortuary, and gate lodges, will be about £120,000. Messrs. Thomson and Sandilands, I.A., are the architects.

THE DRAINAGE OF TOWN HOUSES.

At a meeting of the Society of Engineers, held at the Town Hall, Westminster, on Monday evening, Mr. W. N. Colam, President, in the chair, a paper was read by Mr. G. M. Lawford on "The Drainage of Town Houses." After alluding to some of the now well-known defects in the earlier attempts at house drainage, the objects to be attained in carrying out a perfect system of drainage, with special reference to drains passing under houses, were stated to be as follows:—1, The primary disconnection of the house drain from the main sewer; 2, the thorough ventilation of the entire system; 3, the secondary disconnection of the rain and waste-water pipes from the house drain; 4, the immediate and absolute removal of all matters discharged into the drain from any source whatever; and lastly, 5, the construction of the entire system in such a manner as to prevent foul gases or currents of polluted air from entering the house, and of such materials as to preclude the possibility of the leakage or escape of both gases and liquids. Descriptions of the different forms of disconnection were given, showing the usual type of manhole with intercepting trap and air inlet. With regard to the ventilation of drains, attention was drawn to the fact that in order to create and maintain constant circulation an inlet is necessary as well as an outlet, the position of each being so arranged as to produce a current of air throughout the entire system. The questions of trap ventilation and siphonage were gone into, reference being made to the necessity for ventilating the traps on a horizontal tier of appliances, such as a range of lavatories, as well as those on a vertical tier, such as a soil-pipe. The separate trapping of every appliance was also advocated. The treatment of waste-pipes and the different forms of gullies were taken conjointly, the practice of doubly disconnecting the former by means of hopper heads being strongly condemned. The three essential factors for facilitating the immediate removal of all matters discharged into the drain were stated to be the size and inclination of the latter, and the water supply. Instances were given showing the sizes of drains in relation to the greatest possible volume discharged into them, and the advantages of using 4in. drains were described and advocated. The utilisation of automatic flushing for the removal of grease in preference to its collection by grease traps was also considered under this heading. The water supply and service was touched on briefly, special attention being given to the question of separate cisterns for closets and for domestic purposes, the author maintaining, in spite of the popular belief to the contrary, that, under the special circumstances described in detail, drinking water could be used with safety from a cistern supplying a closet. The construction of the entire system in such a manner as to prevent foul gases or currents of polluted air from entering the house was described as embodying the various points advocated in the paper—namely, thorough disconnection and ventilation, treatment of waste-pipes as disconnected soil-pipes; separate trapping for every appliance; 4in. drains combined with automatic flushing and a good supply of water. The question of the best materials for the prevention or escape of gases or liquids was treated under the three sub-headings of (1) the underground drains, (2) the rain-water, soil, and waste pipes, and (3) the appliances. Regarding the first mentioned, a comparison was given between stoneware and iron, the latter, though undoubtedly more expensive, being given the preference on account of the greater safety obtained by its use, the smaller number of joints required, and the certainty of sound joints between lead soilpipes and the underground drain. The ordinary painted rain-water pipe was described as a nuisance, owing to the certainty of its choking sooner or later from internal rust; and galvanised pipes were stated to be the best for rainwater, and lead for soil and waste-pipes. Regarding the appliances, urinals were alluded to briefly, the author considering them out of place in private houses, and advocating intermittent automatic flushing in all cases. The three forms of closet in general use, namely, the valve, wash-down, and wash-out, were described in detail, the former being considered best. The principal objection to the two latter, when made in one piece of earthenware, being the connection with the soil-pipe; but this difficulty was being overcome by the introduction of lead traps, specially adapted to pedestal closets. In concluding, the author drew attention to the necessity for testing all drains by hydrostatic pressure, as being the only test in any way resembling the pressure to which drains were liable when a stoppage occurred.

CHIPS.

New Wesleyan schools at Shorwell, I.W., were opened last week. Messrs. J. Linington and Son, of Chale, were the builders.



At the last meeting of the Mansion House Council on the Dwellings of the Poor, Mr. John Hamer, the hon. secretary, read the report of the work during the month, from which it appeared that from a further special inspection of Southwark 599 additional sanitary defects had been discovered and reported to the vestry. In addition to this, a block of "model dwellings" in Newington, on being inspected, was found to consist of 80 suites of rooms, the water-closets of which were all untrapped.

The new town hall at Lockerbie, Dumfriesshire, was opened on the 3rd inst. by Sir Robert Jardine, M.P. It is Scottish Baronial in style, and has been built at a cost of £6,000 from plans by Mr. F. J. C. Carruthers, of Dixons, N.B. The walls are of Corncockle red sandstone, with timber finishings of pitchpine. Mr. Wm. Lawson, of Lockerbie, was the contractor for masonry, and Mr. Wm. Douglas, of the same place, for carpentry and joinery.

The Stafford Town Council have instructed Mr. E. Pritchard, of Birmingham, to report on the scheme of sewerage proposed by their borough surveyor, the minimum payment to be 75 guineas, and the maximum 100 guineas, according to the extent of alternative suggestions which might appear necessary to Mr. Pritchard.

St. Anne's Church, Lancashire, erected in 1796, is to be rebuilt at an outlay of between £3,000 and £4,000.

Messrs. Waterlow and Sons, of London Wall, printers and stationers, have purchased about twelve acres of land, near High-street, North, Dunstable, and, following the example set by many other London printers, they intend removing their manufactory to the country. It is stated that this will give employment to 2,000 hands. Temporary iron buildings are to be put up so that business may commence at once.

WAYSIDE NOTES.

INTERESTING accounts of the terrible earthquake in Japan appeared in the *Times* of the 8th inst., and gave one a better idea of the extent and destructive nature of this great convulsion than was to be obtained fron hasty telegrams. The account of the special correspondent gives details of the effect of the earth tremors on structures of various kinds, showing, for instance, how chimney shafts snapped in the middle of their height, and piers and columns sustaining heavy loads fractured at their lower extremities, and how the buildings erected on European methods of construction were destroyed, whilst the works of the Japanese builders were saved. The correspondent expresses a hope that the reports which will be issued on the subject of the earthquake and its results, will be found useful by architects and engineers. At first sight one fails to see how we can benefit in this country by the study of the effect of earthquakes on buildings; but when we consider—as the writer proceeds to point out—that so much work is done in foreign countries with English capital and from English plans, a knowledge of these effects cannot but prove serviceable at one time or another, since there are many countries ridden of earthquakes like Japan. It would appear, however, from these *Times* accounts, that so severe was the rocking motion of the earth in some places, that no construction in the world would have withstood the ordeal. When railway embankments are levelled, and the line of railway twisted up like a snake, arch abutments separate and let down the arches, and the ground itself is rocked up into waves like the ocean, it is evident that nothing in the shape and form of a building can remain standing. Still, the fact of the possibility of earthquakes that will shake anything to pieces should not deter the architect or engineer from devoting study to the subject of strengthening buildings against the minor tremors that are so frequent and common in many countries. I have no doubt that this is neglected wofully in London, plans for mills, factories, and large buildings of this kind being prepared for distant countries without any regard to the dangers of earthquakes. Walls of brickwork in mortar, floor upon floor of iron joists, superimposed column upon column — than which nothing more unsuitable to withstand horizontal movements of the earth's surface can be imagined—such as we employ in this steady, stable land, are the methods of construction adopted. The building takes its chance, generally a very poor one, as is demonstrated by the first serious tremor of the earth. I should imagine that the American architect with his all-iron buildings would be a good man for work of this class. With such construction, a building could be so well "tied" in every direction as to be proof against all baby earthquakes, and show a bold front to those of more matured growth.

I suppose—providing everybody to be safely out of the way—many persons would think it not a bad idea if an earthquake came along, and, confining itself to a few superficial yards, did a little business round by King's College. I notice that the green-eyed monster which has lately taken up its position on the college still remains in all its ugliness, although so many have endeavoured to crack it over the head, and Mr. Waterhouse attacked it with all the valiance of St. George when he "went for" the dragon. As you said last week, the attention attracted by the unsightly brick block has been turned to the subject too late in the day. The building, however, was "sprung" upon the public, and there is some excuse for the delay, as, until the work reached its full height, the eyesore was not apparent.

Many architects will have noticed with regret the letter of Mr. J. C. Robinson in the *Times*, a few days ago, touching the intention of the municipal authorities at Totnes with regard to the old grammar-school. It seems that it is proposed to erect on the site of the school an unsightly police-station. Mr. Robinson points out the beauty of the picture formed by the old grammar-school and town-hall, crowned by the grand old church, and further shows that the grammar-school site, so far from being suitable and convenient for the proposed police offices, is only approachable by way of narrow alleys and steps, and, furthermore, that the old grammar-school buildings would form an excellent museum, which institution Totnes at present lacks. It is so long since I was at this beautiful town, that I have a very hazy reminiscence of the group of old buildings of which Mr. Robinson speaks; but I quite believe it is worth all efforts to preserve. One would think that the authorities at Totnes would be fully alive to the desirability of preserving any old feature of the town calculated to attract visitors; and this little place on the Devonshire Dart is the resort of many such—from honeymoons to vagabonds and tramps. Towns of this nature live on their visitors, and Totnes can be no exception to the rule—rather the reverse, its romantic aspect and situation making it eminently a show-place. Therefore, as I say, one would imagine that those who hold the ropes of local government in their hands would not be so foolish as to destroy a single stone of the old architectural attractions of the place. It just occurs to me that perhaps some outside authority has had the power to take over the grammar school against the private wishes of the people of Totnes, and, if so, it is a wrong to these latter, and should be opposed tooth and nail.

There are many curious things happen nowadays that cause us to wonder and reflect. Among these I would put the proposal of the Salvation Army to bring a Bill into Parliament to override the provisions of the local Acts of Eastbourne, which as at present constituted insure a quiet, peaceful Sabbath to the inhabitants of that pleasant town. Another curiosity is the proposal of Messrs. Fry and Sons, of Bristol, to obtain Parliamentary powers for the removal of one of the city churches of Bristol so that they may use the ground for the extension of their business premises. Here we have two attempts of individuals and cliques to "best" the public and defy the commonweal, such as, if successful, would go far to prove this to be a mad world indeed, and be a strong, logical argument *against* the theory that Carlyle had a touch of the liver-complaint when he affirmed that the millions of English people were "mostly fools." Of the first I say nothing, comment on the subject being out of order in these columns; but of the second I would say that it seems to me to be an astounding thing that there should be enough chance of success for the promoters to feel that the attempt is worth the expense. Unfortunately, however, it would not be a solitary instance of the success of an attempt to make away with a place of public worship for private ends. The sop offered—viz., the erection of another church on another site, little affects the aspect of the case, viewed in its proper light.

Parliamentary Bill promoters, whether private or public, have a suaveness of manner that must be infinitely provoking to the parties their proposals concern. Thus the promoters of the Bill for the extension of the M.S. and L. Ry. to London, when the opposition of the members of the M.C.C. in regard to Lord's was felt, offered as sop a site adjoining the cricket ground, which it was pointed out would render the ground more of a square in shape. It transpired, however, that the ground in question was not the promoters' to give, proving to be the property of the Clergy Orphan Corporation, and now I see a letter in the *Standard* from a member of the committee of this corporation, stating that the proposal to buy the property will be "strongly opposed." The M.C.C., too, seem likely to offer opposition of a formidable character when the Bill is again brought forward, so that if the measure becomes law the promoters will have earned their success.

The storm of discussion in the *Times* respecting the great riddle seems to have subsided, and only low muttering remain on the horizon. A friend refers to it as the *wrangle*, and says there was no discussion at all, and this concurs with my own opinion as previously expressed. What is the practical outcome of the discussion or "wrangle"? I fear it is mere froth, the bubbles of which will burst and the wind go free. Things have changed no more since the appearance of the letters, than they did after the first outburst a year ago. The world wags much the same. If only the writers of the pros. and cons. had soberly discussed the relative merits of, say, round *versus* chisel-pointed pencils for geometrical drawing, the necessary qualification of architects' office boys, or some other really practical subject, we might all have be wiser. As it is, the end is more confused th the beginning; things intended to have be made clear have become enveloped in an i penetrable misty shroud, and the point in di cussion seems further off than ever of a defini settlement. In view of which I recommend t gentleman who starts another controversy abandon the senseless, disingenuous, double-fac title under which the two previous discussio have been carried on, and to find some hone straightforward heading for his communicatio Better still, let the subject rest, and find practical solution in the only way in which ever will be solved—by the lapse of time.

"Architecture: a Profession or an Art?"
R.I.P.

It is not often nowadays that we are privileg to listen to an address like that delivered Tuesday by Mr. Wyke Bayliss to the Society Architects. I shut my eyes now and again a fancied it was the early time of the Architectur Association again, and that Ruskin was thunde ing at us in the old Cockloft at Westminster, in Lyon's Inn, so much now and again did M Wyke Bayliss' matter and method recall those the great ex-Slade Professer. It is good no and then to hear the grand old Legend of Beau thus expounded; better, if the message inde quickens the artist-soul—or what there is left it in us—to deeds worthy of its calling, and t forsaking of the filth of fashion and the wiles the world.

GOTH.

CHIPS.

All the upper portion of the Benedictine Abb of Cormery, some eight miles from Tours, h fallen in. Not more than two-thirds of the edifi now remain standing, and even that portion is such a ruined condition that it is feared it will found impossible to repair it.

The colossal statues of the Mexican patriot Hidalgo and Juarez, ordered of Signor Orsini the Mexican Government, have been finished, an have this week been on view in Rome, in th studios of the sculptors, Concelli and Trabacchi.

At the Walsall County-court on Wednesda week, the Official Receiver concurring, his Hono Judge Griffith made an order for the transfer the bankruptcy case of Stephen Harding Terry engineer's manager, Hednesford, from the Walsa to the Hanley Court. The liabilities are estimate at from £38,000 to £50,000.

The Local Government Board has sent a cir cular to boards of guardians, calling attention t the provisions of the Public Health (London) Act 1891, and to the necessity of at once making regu lations respecting the prevention of nuisances The new law will come into operation with th ensuing year.

A new aisle and transept, which has been adde to the Seacombe parish church, were consecrate on Friday by the Bishop of Chester. The cost o the additions is about £1,600, and they provid additional accommodation for 250 worshippers.

A new hotel, chapel, and four villas will shortl be erected at Whitchurch, near Cardiff, from plan prepared by Mr. Charles C. Jones, architect, o Cardiff.

The City Court of Common Council have decide to adapt certain premises in Aldermanbury a offices for the city surveyor, chamberlain, and town clerk, at a cost of £8,000. They have also voted £21 for the execution of a bust in marble of the lat Right Hon. W. H. Smith, M.P.

The west window of St. Chad's Church, Hopwas has been filled with stained glass reporting event in the life of our Lord. The artists were Messrs Heaton, Butler, and Bayne, of Garrick-street, W.

By a fire which occurred on the night of Wednes day week in the chancel of the parish church o All Saints', Kirkby Overblow, near Harrogate the whole of the fittings and decorations o that portion of the building were destroyed. The accident is supposed to have been caused by a lighted lamp left by the organist being upset by a dog which had got into the church, and was found dead in the belfry. The church dates from 1243, and was "repaired" in 1781.

A sub-committee of the Bristol City Council has been appointed to consider and report upon the propriety of amalgamating the duties of the city surveyor and borough engineer. It has stated to the council that the cost of the departments now amounts to about £4,200 per annum, which is said to be considerably in excess of what is paid for simila work in other towns of corresponding size.

THE REMOVAL AND DISPOSAL OF SEWAGE.

MR. D. T. BOSTEL, of 17B, Great George-street, and 73, Ebury-street, S.W., the well-known sanitary appliance manufacturer, offers a new idea for the solution of the sewage problem. Everything proves (says Mr. Bostel) that the present system of removal and disposal of sewage is a failure; especially where the removal is by gravitation, pumping on the "combined" system, and disposal into the sea, river, or stream; also, if on the land, by "irrigation," "intermittent filtration," or, in fact, any other way. It has always been my opinion that to use water as the carrier of excrementitious matter is unnatural, proving disastrous wherever it is allowed to go. It is of little use to find fault, unless a remedy can be suggested; therefore I will endeavour to explained a practical one that I have discovered and thought out. From the remarks I have already made it will be seen I am in favour of what is known as the "separate" system, although I should not trust to gravitation alone to propel and deliver, but should use in conjunction therewith, "Shone's Compressed-air Ejectors," being able to send the sewage rapidly to cool, and afterwards to deliver it wherever wanted, irrespective of height or distance. For the sewers, especially between the ejectors, I should use iron pipes of as small a bore as possible, the jointing to be run lead or flange-bolted. Properly-planned connections to house-drains could be more easily and safely made than they are now, likewise examined, disinfected, or cleaned. Sewer ventilation would not be required, and, by reason of the absence of leakage, there would be no pollution of subsoil, which at the present time seriously affects the health of the inhabitants of most sewered towns; thus getting rid of contamination both of atmosphere and subsoil. The sewers would be used for the conveyance of excremental and liquid refuse only, which could be shot into tanks or reservoirs placed in elevated positions, and constructed in such a manner that if necessary it could be treated chemically, or otherwise for the best. My idea is that the demand for crude sewage would be so great and continuous that it would not often require treatment by chemicals. From the tanks would be laid leading mains, both for crude sewage and also effluent water. These would be so arranged as to work a powerful hydraulic engine that would put in operation powerful dynamos, generating electricity for lighting and power to farmers and others. These mains would be continued to the surrounding country district, and by branches to the various farms and market gardens, until, and in such a manner, every acre of arable or garden land could easily and cheaply have its natural nutriment whenever it required it. By this plan I can rid the town of a nuisance and injury, besides being able to drain every country village or farmhouse, preventing fever miasma from rising or forming, and the pollution of wells. Farmers could obtain cheap power to thresh corn, grind fodder, or anything else. Every road or lane could be lighted on dark nights, also country churches, chapels, and institutions. To this may be said, "A pretty picture; but what will it cost, and who will pay for it?" I have worked out both questions. The cost will first depend upon the position and size of the town. For my reply and your guidance, I have in mind a coast town containing about 100,000 inhabitants. This town, we will say, now drains into the sea, and all the country round is starving for that which the authorities throw ruthlessly away, having spent thousands of pounds to be able to do so. But this is not the only evil. When the town was sewered, no care was taken as to the jointing being sound—and this is so with all towns!—therefore the subsoil is every day becoming more polluted, affecting water-mains with unsound joints (and there are not a few of these about), and thus affecting the water supplied to the inhabitants. By contaminated air-currents the surrounding dwellings are likewise rendered unhealthy. All these facts must be taken very seriously into consideration. Then, with regard to the sea or river, it might be said in many cases, we have taken our sewage a long way from the town. This may be so; but then other districts spring up, and they pitch their filth into the same sea or river, causing the tides to leave their corrupt deposits equally along the shore; therefore the question is to be looked at in more ways than one. The re-sewering would be beneficial to the health and reputation of this and all other health towns. With these precautionary remarks, I will now say what the entire cost would be to do everything—viz., to devise and equip an entirely new system of sewers, with the Shone ejectors and compressed-air engines, mains, reservoirs, tanks, engines, telegraph wires, &c.—I put at about £200,000. Against the cost must be shown probable return or profit. The quantity of good crude sewage would be about 3,600,000 gallons per day. If this were sold crude it would fetch, say, 3d. per 1,000 gallons at the farm. But, for ease of calculation, say 20,000,000 gallons per week, or £13,000 per annum; estimated receipts for lighting and power, £7,500; or a total revenue of £20,500, a sufficient margin to provide many other beneficial improvements for the inhabitants of the town adopting my suggestion. But we do not leave off here—we have other and more vital benefits to consider, viz., extra productiveness of the land! I have consulted practical farmers upon this question all through, and they unanimously agree that it will double the production. One old farmer puts his case thus: "When I get 5 quarters of corn per acre I consider it very good; but if I could get that sewage at the right time, and as often as I required it, I could grow 10 quarters per acre, and harvest a week or fortnight earlier." Market gardeners and florists are still more sanguine of the great things they could do. I should just like to say another word about the health point. In the town I have in mind, the death-rate would be about 16 per 1,000, according to the Registrar General's returns; but if the removal of sewage were carried out in the manner I have suggested, I feel convinced the rate would never exceed 7 per 1,000. Added to this is the better health and increased working power of the inhabitants generally.

Mr. Bostel's suggestions are certainly worth careful consideration, and we shall be glad to see the more complete and elaborate statement of his idea, which he promises presently.

THE BRADFORD ISOLATION HOSPITAL.

ON Tuesday week, Dr. Barry, an inspector of the Local Government Board, made an examination of the new infectious wards erected by the Bradford Corporation in extension of the Fever Hospital, Leeds-road. The new wards stand upon the higher portion of the hospital grounds towards Hawksworth-street. The new isolation hospital is the only building of the kind in the kingdom, and is constructed on a special plan designed by Mr. Morley, of the firm of Morley and Woodhouse, 269, Swan Arcade, Bradford, the architects of the circular hospital at Barnsley in 1889. The new Bradford hospital has two wards, each 72ft. by 15ft., placed back to back, with a space of 3ft. between them. Bath-rooms, w.c.'s, slop sinks, and linen shoots are arranged at the end of each ward, and nurses' rooms adjoin the wards at the entrance ends, with supervision windows to each ward. A private ward is also provided. A special feature of the arrangements is an undressing-room for convalescents, where they leave behind hospital clothing, and then pass into a bath-room, and thence into a dressing-room, where their own clothes are put on, and from this room they pass direct into the outer air. An administrative department, communicating with the ward block by a covered corridor of glass, is provided, and contains kitchen, scullery, pantry, linen store, doctors' room, and matron's room on the ground floor, and several bedrooms for nurses, &c., on the upper floor, and the needful w.c. and bath accommodation. The washhouse block comprises a washhouse, laundry, drying closets, and a steam disinfecting apparatus by Messrs. Goddard, Massey, and Warner, of Nottingham. The drying closet, steam boiler, and washhouse and laundry fittings have been supplied by Bradford and Co., of Manchester. The drainage is divided into two separate and distinct systems. The one for roof and surface water goes direct into the mains, but all the foul drains empty into disinfecting tanks, which are duplicated, so that whilst one tank is being emptied after disinfection, the other is receiving the drainage, and going through the process of disinfection by an admixture of chemicals. Special arrangements are made for the destruction of the germs of disease. All the windows are made tight, and the fresh air is let in by three shafts from the outside, carried under floors and into the lowest compartment of the 3ft. space between the two wards. Above this compartment, and divided from it by flags with open joints, in another compartment, are placed the heating pipes, and from this compartment flues are carried into the wards which conduct the fresh air (warmed in cold weather by contact with the heating pipes last named) into the same through gratings in the floor, one being placed at the foot of each bed. Above the compartments above named is an extracting flue made perfectly air-tight, and into this flue openings are made at the ceiling level of the wards over each bed. A powerful furnace, with honeycomb fire-brick divisions, is placed in the cellar at the end of this flue, and this furnace draws the foul air out of the wards, and it passes through the furnace and out into the open air by a large chimney. Thus all vitiated air from both wards, w.c.'s, bath-rooms, &c. (which are all connected with the flue), passes through a furnace which is heated up to at least 800°, and therefore is more than sufficient to destroy all obnoxious germs. The working of the scheme has been properly tested by the anemometer, and it has been found that at least 10,000c.ft. per hour per patient can be passed through the wards, and out through the furnace, and that at the same time in cold weather a temperature of at least 60° can still be maintained in the building. Following the method adopted by Messrs. Flockton and Gibbs in their Sheffield Municipal Buildings design, the idea and plan of the hospital have been patented by Mr. Morley, in conjunction with Mr. E. Oldroyd, heating and mechanical engineer, of Crown Works, Leeds. The contractors of the building have been: — Mr. Farnish, mason; Wilkinson and Dawson, joiners; J. Wood, plumber, Cordingley and Sons, plasterers; Hill and Nelson, slaters; and J. Arundel, painter. Mr. Bancroft has acted as clerk of works.

CHIPS.

At the Yeovil County Court on Thursday in last week, the matter of the bankruptcy of Mr. Wm. Palmer, surveyor, of Bruton, came before the court. His Honour (Judge Machonochie) gave judgment on the application made by the bankrupt for his discharge. He granted the discharge on the debtor agreeing to judgment being entered for him to pay a dividend of 10s. in the pound to unsecured creditors.

A statue in honour of the late Mr. Henry W. Schneider has recently been unveiled at Barrow-in-Furness. The commission has been executed by Mr. Percy Wood. The statue, which is in bronze, is 10ft. in height, and represents Mr. Schneider wearing the mayoral robes. It is placed on a circular pedestal of polished Aberdeen and Swedish granite. The memorial occupies a commanding site near the Town Hall at the junction of the High Level Bridge and Dulse-street.

It is probable that the United States Government will issue the invitations to the International Congress of Electricity, to be held in Chicago in 1893, through the Governments to which those invited belong. It is thought that such an arrangement will give an official character to the proceedings of the Congress, and that some uniform system of standards may be agreed upon.

The foundation-stone of a refuse destructor, in course of erection for the Aston Manor local board, took place on the 25th ult. The works consist of an eight-cell destructor, roofed over, and in connection with same is a Jones' fume cremator, a chimney-shaft 100ft. in height, and an inclined approach for the carts to be drawn up to discharge the refuse on the top of the furnace, which is fed from above. The contractors are Messrs. Manlove, Alliott, and Co., engineers, Nottingham, and the engineer, Mr. Augustus Davies, surveyor to the Aston local board.

The Cannock school board decided at their last meeting to erect a girls' school, to accommodate 350, adjoining the infant school at Chadsmoor. It was decided to ask Messrs. S. Loxton, Cannock; Scrivener and Sons, Hanley; Ambrose Wood, Tunstall; Crouch and Butler, Waterloo-street, Birmingham; G. H. Cox, Temple-street, Birmingham; and F. F. Bailey, Walsall, to send in competition plans for the building, the cost not to exceed £6 per head.

The London County Council decided on Tuesday to form a new department, to be known as that of Public Control. It is to be under the direction of Mr. Spencer, now chief inspector of weights and measures, as chief officer, and is to consist of 4 clerks, 44 inspectors, and 42 assistants, all now in the employment of the council. Mr. Spencer's salary will be increased to £650 a year, and rise by yearly increments of £25 to £700 a year.

Building Intelligence.

Allahabad.—Another stage towards the completion of All Saints' Church, Cannington, proposed to be ultimately the cathedral of the Lucknow diocese, has been reached, as the new nave was consecrated on Nov. 12. The first stone was laid in 1871, but no portion was opened till January, 1877, when the chancel, transept, and a temporary nave were finished. That nave has now been demolished, and on its site stands the six eastern bays of the permanent nave. This has a length of 85ft., a width of 56ft., and a height from floor to top of ridge of 65ft. It is shut in by a temporary western wall of brickwork. The style is Early English, adapted to suit Indian climate and requirements. The material used throughout the edifice are white Scorajpur stone for the walling and red Mirapur stone for mouldings. The whole of the works have been carried out from the plans of Mr. William Emerson, by Messrs. Frizzoni and Co. The church now seats 700 persons. To complete the scheme there remain to be erected two western bays of the nave, the western façade and two flanking towers, and the central square lantern. The church was illustrated in our issues of Nov. 25 and Dec. 9, 1887.

Lamington.—A dedication service was held on Saturday at the new memorial chapel, erected by Lord Lamington, attached to the Episcopal Church in the grounds of Lamington House, near Biggar, N.B. The Bishop of Glasgow officiated. The entrance to the chapel is from the north side of the chancel, through a double archway supported by stone pillars; the exterior and interior walls are of stone, the roof being of open oak work. The windows, which are in keeping with the thirteenth century style of the chapel, are all but one filled with stained glass by Ballantine. The floor is laid with red tiles, and in the centre is a tomb to the memory of the late Lord Lamington. This is of marble and alabaster, surmounted by a Mediæval cross in relief, and with the inscription relieved on a gold ground. It was executed by Mr. John Rhind, Edinburgh. The architect was Mr. George Henderson, of Hay and Henderson, of Edinburgh.

Leamington.—Special services were held at Holy Trinity Church last week, in celebration of the reopening of the chancel, which had been lengthened by the addition of a new reredos and the filling in of the east window with stained glass, at the cost of one donor. The reredos is in the form of a recess, in depth 4ft., and in length 3ft. The three central bays of the arcade have panels of alabaster carved with natural foliage and emblematical devices. The other panels are filled with foliage. The carving was executed by Mr. Bridgman, of Lichfield. Within the Communion rail, the floor is laid with mosaics, and the steps are of Devonshire marble. The designs for the reredos were prepared by Mr. Jethro A. Cossins, of Birmingham. Mr. W. F. Lee carried out the stonework. Mr. Lee is now preparing, under the direction of Mr. Cossins, new stonework and tracery for the south transept window of that church, to be filled with stained glass. The work was designed and executed by Messrs. Heaton, Butler, and Bayne, of Garrick-street, W.C.

Leicester.—St. James' Church, Ayleston Park, Leicester, the second of the inexpensive churches built by the Leicester Church Extension Board, was consecrated on the 3rd inst. The contract for the fabric, which is to hold about 600 people, was £2,350, and of the heating, fences, chairs, and other fittings about £500, and of an ambulatory to connect the church with the mission-room about £100. The church is faced with white bricks, and red-brick dressings and dado; the roof is in one span, with tie-beam trusses. There is a baptistery at the west end, but the chancel is not yet built; the nave is 89ft. long and 42ft. wide inside. The architects are Messrs. R. J. and J. Goodacre, FF.R.I.B.A., and the contractors Messrs. T. and H. Herbert, all of Leicester.

It is announced in Tuesday's *London Gazette* that the partnership hitherto subsisting between T. C. Maxwell, J. Maxwell, W. C. Tuke, and F. W. Maxwell, under the title of Maxwell, Tuke, and Maxwell, of Blackburn, architects, surveyors, estate agents, and valuers, has been dissolved.

Engineering Notes.

The New Railway from Sheffield and Nottingham to London. — Some important changes have been made in the scheme for extending the Manchester, Sheffield, and Lincolnshire Railway Company's system to London. The chief alterations have reference to the Metropolitan terminus, which, instead of being placed on the site of Boscobel-gardens, Alpha-road, is to be brought forward to the Marylebone-road, and will thus front the same thoroughfare as the termini of Euston, St. Pancras, and King's-cross. Two new branch lines are proposed from the main line into the passenger station, one to a proposed coal depot near Carlisle-street, the other to form a junction with the Metropolitan Railway under the Marylebone-road. In carrying out these works the company will be compelled to close up certain streets and roads, in exchange for which they propose to construct two new streets, giving access over the area affected. The arrangements as to the taking of property in St. John's-wood for the purposes of a goods station remain as they were last session. Certain alterations have also been made in the country route, which will leave the scheme practically unopposed so far as the extra-Metropolitan part of it is concerned.

The Proposed Subway Railway Extension to Islington.—The Bill for power to extend the City and South London Railway to Islington has undergone material amendments since the rejection last session by a Select Committee of the House of Commons. In the present Bill it is proposed to connect the extension by a physical junction with the existing railway of the company, instead of a footway, thus removing one of the main objections raised by the committee to the Bill of last session. The new scheme also provides a subway for foot passengers, from the north end of Fish-street-hill to the proposed extension line, whilst power will be sought to connect (by means of a subway) the existing railway on the Surrey side with the London Bridge Station of the London and Brighton Railway Company. The terminus of the proposed extension in the City-road, Islington, will be at the same point as that proposed in the scheme of last session.

The Central London Railway.—Preliminary borings for this proposed railway, for which an Act was obtained last session, have taken place under the direction of the chief engineer, Mr. Greathead (the constructor of the City and South London Railway). The experiments have turned out, it is alleged, satisfactorily, the soil being very easy for working purposes. Profiting by his experience with the South London Railway, Mr. Greathead has suggested having a rather larger tunnel than was employed in that case, and that, instead of brick, it should be composed entirely of iron, the latter suggestion being due to the necessity for having a much stronger casing where there are so many heavy buildings as in the City and West-end. The tunnel will be a considerable distance below the surface. It is possible that, unlike the other electric railway, there will be two classes, and the length between the two termini (London Bridge and Shepherd's Bush) is too great to allow of the same fare being charged for any distance, for there are likely to be thirteen or fourteen stations. It has not yet been decided at how many points the tunnelling is to take place.

COMPETITIONS.

London, E.C.—The competition for St. Bride's Institute, on a site adjoining St. Bride's Churchyard, has been settled in favour of Mr. R. C. Murray, of Racquet-court, Fleet-street. There were about twelve competitors in the first contest, and these were reduced to three—viz., Messrs. Saxon Snell, Roger Smith, and Gale and Murray. The work will comprise a library, baths, &c., and will cost about £15,000. The design is in a Classic style to harmonise with St. Bride's Church.

Glasgow Art Galleries.—Fifty-five designs have been submitted in the preliminary competition for the Art and Music Galleries for Glasgow. Mr. Alfred Waterhouse, R.A., is the assessor, and commenced his duties of examination at Glasgow on Tuesday. He will select six designs, whose authors will be invited to take part in a second competition.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Leeds and Yorkshire Architectural Society.—The first lecture of the present session of this Society was delivered on Friday night in the Leeds Law Institute, Albion-place, by Mr. Wm. Bruce, whose subject was "Cements, Concrete, and Lias Limes." Mr. W. H. Thorp (President of the society) occupied the chair. The lecturer said that if Leeds architects, contractors, and workmen were not interested in his subject, he did not know who would be, for it was a Leeds bricklayer who invented Portland cement, though his invention was a dead letter for a long time. In 1824, Joseph Aspin, a Leeds bricklayer, took out a patent for an admixture of limestone and clay, which from its resemblance to Portland grey stone, acquired the name of Portland cement. This cement was of considerable utility in the construction of the Thames tunnel. In 1848 Britain, he said, had only four important cement works, and the first really important one was started in 1859. Mr. Bruce pointed out that the German cement manufacturers long ago formed an association, and drew up standard rules defining the qualities of cement, and laying down methods of testing, and it was owing chiefly to this wise co-operation of her merchants that Germany was now turning out such large quantities of cement. Hitherto, English manufacturers had not generally seen the desirability of adopting a similar course. After touching on various technical points in relation to cement, Mr. Bruce went on to speak of concrete, and confined his observations in this connection chiefly to technical advice to his audience. Going on to speak of local matters, the lecturer said he had been much surprised and disappointed with the condition of house drainage in Leeds. When he came to Leeds some fourteen months ago he was surprised to see, and could not understand why the municipal authorities allowed and approved of, such work as could be seen any day in any district of the borough. He had had charge of large and important buildings in many towns, and his experience of other towns had been that building inspectors and borough engineers had encouraged improvements in sanitary science. But a very short time spent in Leeds municipal department was sufficient to show that the building by-laws were not administered in accordance with the principles of modern sanitation. The great mistake was in the erroneous administration of the by-laws. Very little or no provision was made for the ventilation of house drains in Leeds, but there was an ancient and faulty system of large gullies discharging into drains formed with injuriously large pipes, badly laid and badly ventilated. The lecture was illustrated by means of samples, tests, and tables of test-results.

The Public Health Act of London, 1891.—At the monthly meeting of the Sanitary Inspectors' Association on Saturday evening, at the Carpenters' Hall, London-wall, Mr. E. Lewis Thomas, hon. counsel to the association, gave an address on "The Public Health (London) Act, 1891." Mr. Hugh Alexander, chief sanitary inspector, Shoreditch, chairman of the council, presided. Mr. Thomas said that since 1875 several attempts had been made to codify the sanitary enactments relating to London. Those attempts had been unsuccessful until the present year, when there was accomplished for the Metropolis what had been done sixteen years ago for the rest of the country. They had, however, at last one sanitary code operative throughout the Metropolis, except in so far as regarded the powers exercised by the authorities who administered the Housing of the Working Classes Act, 1890, and the Common Lodging-houses Act. Mr. Thomas then entered into a minute analysis of the Public Health (London) Act, 1891, and explained the modifications which it had effected in previous legislation, and the powers which it conferred upon sanitary authorities. He expressed the hope that the London County Council would form a centre for the dissemination of information to local authorities with respect to outbreaks of disease, and the best means of dealing with them. Mr. Thomas further advocated the appointment of a Minister of Health, who should be a member of the Cabinet, and whose Department undoubtedly would be one of the most important in the Government. The draughtsman of the Act passed this year had done his work well, and it remained to be seen what the vestries and district boards would allow the sanitary inspectors to do with it.

TO CORRESPONDENTS.

We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to T. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 50 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

F. HARRISON. (Better join the Society of Architects. If you write to the secretary, Mr. G. A. T. Middleton, St. James's Hall, Piccadilly, W., he will send nomination papers and all particulars.)

"BUILDING NEWS" DESIGNING CLUB.

"PROGRESS G." (Your drawing received, but it is drawn on too large a sheet of paper. See rules, where size is given.)—FRANK B. SMITH. (Your drawing *was* acknowledged in our issue for Nov. 20th last.)—R. H. H. CLUEAS; SPINHX.

Correspondence.

RE "CRAFTSMAN ARCHITECT."

To the Editor of the BUILDING NEWS.

SIR,—Mr. Wilson's advice in his paper on the late J. D. Sedding, that "the designer ought to erect his own building," is surely a note in the right direction. But it is hardly desirable that he should turn "builder," there being already a plethora of that genus—otherwise builders' clerks—in the market, devoid of every particle of sympathy with their work beyond that of £ s. d. In works of any magnitude, I should like to suggest the abolition of the conventional "builder." There are plenty of men of real practical and administrative ability among the ranks of builders' foremen and clerks of works to take his place—men with a love, almost innate, of their work. The best work we can get from the average builder is but a compromise. Some of the very best of our buildings erected in the metropolis and other places in recent years have been carried out in a way similar to that I suggest. The architect would then be entire master of the situation, the building manager working under his supervision and to a schedule of prices. It is within my own knowledge that churches—some of the best—have been built by a contractor whose practice was to buy plant for each separate contract, disposing of it by sale at the completion of each job, thus saving establishment and other expenses. Surely an architect could do this!—I am, &c.,

VIGILANT.

"ROGERS v. JAMES."

SIR,—If the plaintiff in the above case is a member of the R.I.B.A., I quite agree with "J. R. W." (and your suggestive "if!"), "that, in the interest of the profession," it might be as well for the Institute to take action on the case, but not in the law courts.

I have not seen the *Times* report of the case referred to, but the *ex parte* letter in your issue of the 27th ult. sheds some side-lights on the matter that "J. R. W." seems to have overlooked or blinked.

The balance of fees was reduced by half, and the explanation of it that "the major portion for designing and carrying out furniture and decorative work for which he charged 10 per cent.," is not very clear, as the only item in dispute mentioned is "concrete under footings," implying a different class of work in an expenditure of £2,000.

But it is to the omitted concrete that "J. R. W.'s" attention might have been usefully directed "in the interests of the profession" What is said about it in the letter of the 27th ult. is rather conflicting, and so contrary to ordinary practice as to suggest inaccuracy or laxity. If the omitted concrete was not necessary (which the architect must have seen if he "paid daily visits at the time," for all architects look carefully to foundations, or should do so), he ought at once to have given an order to the contractor to omit it, and deduct for the excavation and concrete so admitted. It is silly to talk of "taking advantage of absence," or of deducting for "underpinning the walls in cement," unless the contractor was to be let "give a yard and take an ell" *or two*. Still, it may be all right with "decorative" or "art" or "craft" architects, although some may prefer the old commonsense way.

M. M.

Intercommunication.

QUESTIONS.

[10676.]—**Lime.**—I shall be greatly obliged for enlightenment on the following:—So far as I can ascertain, no one nowadays seems to understand scientifically the action of ordinary rich limes, from the burning of the stone to the using of the resultant mortar. I read that the Romans passed a law that no lime should be used till it had been slaked three years. I also know that contracts frequently stipulate that mortar must be, at least, three months old before being used. Yet the consensus of opinion seems to attribute the setting of lime to hydration, the carbonisation it ultimately undergoes taking so long to accomplish as to be of little practical value. I also know that hydration, as in Portland cement, so in lime, takes place almost at once, e.g.: If I take a piece of limestone, say magnesian or mountain limestone, burn it, and slake it, I resolve it into a paste at once, which will set hard in an hour, without contact with bricks, &c. (I have done this often.) If, then, this hydration takes place so quickly under these conditions, how can it be good to prevent the resultant setting by leaving the lime slaked only to a dry powder till wanted, or to add so much water as to prevent the setting, as the Romans appear to have done, and as the ordinary contractor nowadays appears to do? After the lime has lain for months with far more water than it can take up, and, therefore, the process of hydration spent, what makes it set when it is used as mortar? If it does not set when in a thin, pasty mass by itself, why should it set because placed between two bricks, and how long is it supposed that that pasty mass will keep as such without deteriorating? Indeed, judging from the way people act, it would seem that the longer it is kept the better mortar it makes. I have no doubt the scientific explanation of the foregoing will prove very generally interesting.—H. C. SWAN.

[10677.]—**Testing Mortar.**—Will anyone kindly inform me how to find out the quality of mortar when it is mixed?—INDOCTUS.

[10678.]—**Surveying.**—In measuring a field with a very big fall, do you take the actual surface or the horizontal, as in a map?—A. W.

[10679.]—**Perspective.**—Will someone kindly explain if the ordinary method of setting up a perspective from a plan, as described in Spon's Pocket book, can be used for internal views, and how? In an ordinary-sized room, what is a good distance for the point of sight? Any practical hints would be received with thanks.—A. W.

[10680.]—**Lead Roof.**—I would feel thankful to any reader of the BUILDING NEWS for reply to the following query:—If good old 7lb. lead, which is a roof covering 70 years, can be taken off old, flat roofs, and re-used on the modern system, viz.: steps and rolls on new timber roofs?—FRANCIS NUNAN.

REPLIES.

[10663.]—**Timber.**—Mr. W. Stevenson's reply to "Woodenhead" does not clear up the confusion referred to by the latter. Mr. Stevenson says "that red pine, Pinus rubra as in Hurst's handbook, should read Pinus resinosa." Now, Michaux, in his "North American Sylva, Philadelphia," ed. 1850-51, p. 67, Vol. III., states:—"The bark upon the body of the tree is of a clearer red than upon that of any other species in the United States; hence is derived its proper name, and hence I have substituted the specific epithet 'rubra' for that of 'resinosa' employed by Aiton, and adopted by Sir A. B. Lambert. Another motive for the change was to prevent a mistake to which many persons would be liable of supposing that this species affords the resinous matter so extensively used in shipbuilding." The fact is, Mr. Stevenson has followed J. C. Loudon, who obtained his information from W. Aiton's "Hortus Kewensis" (a catalogue of plants cultivated at the Royal Gardens of Kew, and published in 1810); whereas it is evident that Mr. Hurst has followed Michaux, who is certainly the best authority on North American timber trees, and an eminent botanist into the bargain. As to Mr. Hurst's statement that the red pine is a mere variety of the Pinus sylvestris, it may or may not be correct, as it all depends on the definition of the term "species." In these Darwinian days the tendency is to widen the definition; and as the red pine of America has much in common, botanically, with the Scotch fir (P. sylvestris), some would consider them mere varieties, the coarseness of grain, or colour of the wood or bark, which are dependent on soil, having nothing to do with the botanical classification. As to the grain of the Pinus sylvestris being finer than that of the red pine, Michaux describes the wood of the latter "when wrought as exhibiting a fine compact grain." In many cases there is no doubt it has more sap than the better quality of Baltic pine. But again to quote Michaux, p. 67: "The timber is said to consist in too great a proportion of sap; but the objection appears to me unfounded. Several trunks 1ft. diameter that I have examined contained only 1in. of sap." Again, Mr. Stevenson states that the red pine "is a soft, mild, undurable wood, of no special value in the trade"; but Michaux says: "In Canada, Nova Scotia, and the district of Maine it is highly esteemed for strength and durability, and is frequently employed in naval architecture, especially for the decks of vessels, for which it furnishes planks 40ft. long without knots." Mr. Laslett, who was, I believe, a timber inspector in one of H.M. dockyards, and may be credited with knowing something of timber, on p. 271 of his book on Trees, says: "It is tough, elastic, moderately strong, and possesses a clean, fine grain, which works up well, leaving upon the surface a smooth, silky lustre. It is not apt to shrink, split, or warp much in seasoning, and, technically speaking, it stands well, which renders it a choice and very valuable wood for all kinds of construction." And, further on, he adds: "It has but little albumen or sap-wood. In reply to "Sappy," I would refer him to Michaux, "N.A. Sylva," p. 66, Vol. III., from which I have taken the following botanical names, viz.:—

Two-leaved Pines
Cones Smooth.
Red (Norway) Pine..... ..... Pinus rubra
Wild Pine or Scotch Fir .... Pinus sylvestris

Three-leaved Pine.
Cones Smooth, or with Small Thorns.
Long-leaved Pine .... Pinus Australis

Cones very Thorny.
Pitch Pine .... Pinus rigida

Five-leaved Pine.
White Pine .... Pinus strobus

Loudon, in his "Encyclopædia of Trees and Shrubs," following Miller's "Gardener's Dictionary," also gives Pinus rigida for the pitch-pine, which, he says, "is the name it is known by all over the United States." The fact is, that what is called pitch-pine in this country, and named Pinus resinosa by Gwilt in his "Encyclopædia of Architecture," p. 499, ed. of 1857, is really not the true pitch-pine at all, but probably the long-leaved pine (Pinus Australis) of Michaux.—J. S.

[10670.]—**Infectious Diseases Hospital.**—One of the best books on the planning and construction of above hospital is that issued by the Local Government Board as a Parliamentary paper of 1882, viz.: "On the Use and Influence of Infectious Hospitals," by Dr. R. Thorne Thorne, Assistant Medical Officer to the L.G.B., with many maps and plans, price 14s. 6d. The Local Government Board also have issued "Specimen Plans of Small Hospitals for Infectious Diseases" (four, six, and ten beds), and "On the provision, by Local Authorities, of Hospital Accommodation for Infectious Diseases." The last named is also published by Messrs. Knight and Co.—C. C. S.

[10670.]—**Hospitals.**—I should think that "Sanitary" will find "Hospital Construction and Management," by F. J. Mouet, M.D., F.R.C.S., and H. Saxon Snell, F.R.I.B.A., will be about the best and most modern book he can get on the subject, and may most likely be bought from Batsford, of High Holborn.—T. W. HUDSON.

[10673.]—**Evening Classes.**—Mr. Busbridge, a most competent teacher, holds classes all over London. The fees are moderate, and the instruction sound. His address is, I think, "Grasmere," Plumstead.—T. F. MAY.

[10674.]—**Wood-Block Floor.**—I would suggest to above that the soil on the outside of the building be lowered at least 6in. or 9in. below level of floor, and a channel of brick or concrete formed round the building, with a fall to the lowest end for the water to run into a tank, which can be pumped out any time it requires the same. This is about the only way to remedy same, and is often used in our old church restorations, where the yards rise considerably in the course of a few years. Of course I need hardly say make the tank large enough to take whatever quantity of water is likely to collect.—T. W. HUDSON.

[10675.]—**Laying-out and Drainage of Burial Grounds.**—"Gottsacker" will be able to find much valuable information in "The Municipal and Sanitary Engineer's Handbook," by H. P. Boulnois, M.Inst.C.E., (publishers, E. and F. N. Spon), from the chapter on "Cemeteries," and from "New Law of Burials for Sanitary Authorities," which is fully annotated, and contains practical suggestions, &c., by T. Baker, barrister-at-law. Knight and Co., Fleet-street, publishers.—C. C. S.

The Wesleyan chapel at Wetherby was reopened on Sunday after reflooring, the substitution of a rostrum for a pulpit, and of pitch-pine seats with stall ends for high pews. The chief contractors were Messrs. J. Parnaby and A. Allen, of Wetherby.

Legal.

QUANTITY SURVEYOR AND BUILDER.

It has often been urged that a good and valid custom exists by virtue of which upon a contract being entered into by an owner with a builder through an architect, the previous employment of a quantity surveyor by that architect as agent for the owner, is at once shifted into an employment by the builder, who thereby becomes liable to pay that surveyor for taking out the quantities. The existence and validity of that custom has now been recognised and upheld by a Divisional Court composed of Mathew and Smith, J.J., in the recent case of "North v. Bassett" (18th Nov.) see *Law Times*, 28th Nov., p. 61. That was an action by the plaintiff, a quantity surveyor, for fees alleged to be due to him from the defendant, a builder. The plaintiff had been employed by the architect in the usual way to take out quantities for a certain building. The defendant tendered for the work; his offer was accepted, and a contract entered into. In the estimate there was the usual clause as to the payment of his stated fee to the plaintiff, as quantity surveyor, and of the first certificate. Plaintiff applied for his money, and as the builder refused, he brought this action in the Lord Mayor's Court, London. At the trial evidence was given that the custom is that the architect employs the quantity surveyor, who supplies the builder with the quantities, and who is responsible to him for their accuracy; then the surveyor's fees are added to the builder's estimate, and are paid by him out of his first cheque. The plaintiff was nonsuited on the highly technical grounds that there was no priority of contract between the plaintiff and the defendant, and that the plaintiff could not sue upon the tender as he was not a party to that document. It was argued also, upon the plaintiff's appeal, that the only person liable was the architect. The Divisional Court, however, held that the nonsuit was wrong, and sent the case back to be tried again. They also ruled that the custom sworn to did exist, and was notorious, and that, therefore, the defendant, as builder, became liable to pay the plaintiff, as quantity surveyor, his fees upon the promise implied by that custom, and by the acceptance of his tender based upon the quantities so taken out and supplied by the surveyor. It is satisfactory that so important a point of practice should be thus far settled in accordance with usage and common sense.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

W. E. D.—Wall.—Erection.—Prospect.—You are certainly quite right in advising that there is no legal remedy in the way of damages in this case, as the erection is not a trespass, neither does it interfere with light and air, although it may damage the prospect or appearance of your client's property. This gives no ground of action; but perhaps the district surveyor or local board people might be persuaded to interfere.

Bricked Up.—Right of Way.—Dog.—Upon the facts stated, it is clear there never has been a legal right of way over this ground. The proprietor of the house A never had any right of way over the adjoining land; but had merely a hole in his own wall opening thereon for his dog to enter. This would not create an easement, even if it had been enjoyed long enough, and had not been abandoned, as the case states.

LEGAL INTELLIGENCE.

In re J. Greenwood.—James Greenwood, builder and contractor, carrying on business at Maltby-street, Bermondsey, and 86, Cannon-street, E.C., against whom a receiving order was made on the 4th ult., has submitted a statement of his affairs showing liabilities £12,330, of which £5,541 are unsecured, with an estimated surplus in assets of £7,136. The debtor states that he commenced business originally about 26 years ago, and his total capital, including his private property, amounted on October 1, 1889, to about £25,000. He attributes his failure to losses on trading and contracts, chiefly through depression in the building trade, the severe winter of 1890-1, and the recent long strike; also to his inability to realise his property, to his lack of available capital, and to the consequent pressure by creditors. The debtor has not lodged any proposal.

Mansbridge v. Woods.—In this case, which was heard in June last, Mr. Justice Hawkins gave judgement on Monday, Dec. 5, in the Queen's Bench Division. It resulted in an unexpected manner. The plaintiff, Mr. Mansbridge, a builder, sued Mr. Woods for balance due on account of a house he built for him at Bellagio. The defendant alleged that the contract had not been properly carried out, and charged plaintiff and his architect with collusion and fraud, also counterclaiming accordingly. The case was eventually, by defendant's wish, referred to a quantity surveyor, appointed under the Arbitration Act by the President of the Institute of Architects. Mr. H. F. Dickens, who appeared for the plaintiff, said this was an instance of an unfounded charge recoiling on the accuser's head. The referee, a Mr. Thacker, had estimated the house on "measure and value," and had accordingly valued the house at £1,702. The original contract, which the defendant had repudiated, was for £1,425, of which he had paid £1,325. The plaintiff claimed the balance of £100, or, as an alternative, £185 balance, estimating the house on "measure and value." The defendant, by his own action, had therefore rendered himself liable for a larger sum. Mr. Tindal Atkinson, for the defendant, contended that his client was entitled only to pay the original claim on "measure and value"—namely, £185, arguing that that was all that the plaintiff claimed, and was his own estimate of the work. Mr. Justice Hawkins, in delivering judgment, said that the defendant having agreed to refer the question, he must abide by the result, whether favourable or not to him, and he should therefore give judgment for the plaintiff for the £377, difference between the contract price and the referee's estimate, with costs, including those of the referee. Judgment accordingly.

Re John O'Kill.—This debtor was a builder in Picton-road, Wavertree, and came before the Liverpool Bankruptcy Court on Friday with a statement of affairs showing liabilities £1,367 expected to rank against the estate for £591, and assets £151 15s. 10d. He attributed his failure to bad trade, losses on contracts, and shortness of capital. The Registrar ordered the cash-book to be written up, an amended statement of affairs to be filed, and also a deficiency account. The examination was adjourned to January 14th.

Swansea.—Important Rating Appeal.—Under the revaluation of the Swansea Union, which has been in progress for a considerable period, several appeals have arisen and been carried to the Quarter Sessions of Glamorganshire. One of these appeals, that of the Atlantic Patent Fuel Company, was by agreement referred to the arbitration of Mr. Samuel Green, F.S.I., of London, and involved the question which has given rise to so much heartburning—viz., the correct method of dealing with machinery for rating purposes. The arbitrator, having held several sittings, at which Mr. Eve appeared for the Union, and Mr. Humphreys-Davies, Surveyor to the National Association of Machinery Users, for the appellants, has now made his award, reducing the assessment from £1,762 to £1,412, and ordering the costs of the arbitration to be paid by the assessment committee and overseers.

In re F. W. Fryer.—Under a receiving order made against Frederick William Fryer, architect, surveyor, and newspaper proprietor, carrying on business at Loudoun House, Surrey-street, Strand, a statement of affairs has been submitted showing liabilities £2,790, of which £2,735 are unsecured, with assets £62, in addition to certain other property of which the value is unascertained. From the observations of the Official Receiver (Mr. H. Brougham) it appears that the debtor commenced business in 1886. In April last he published a trade journal, which he recently assigned to a company in consideration of £2,000 in shares and £500 to be paid in cash; but, in consequence of the company not being successfully floated, such shares and purchase money are of uncertain or no present value. He attributes his insolvency to the non-fulfilment of the contract to purchase this journal, to loss and liabilities on accommodation bills, to heavy interest on borrowed money, and to loss through failure of a builders' institute, of which he was the originator and vendor to a company. The debtor has not lodged a proposal, and has been adjudged bankrupt.

STAINED GLASS.

Bradford.—The four side chancel windows of St. John's Church, Bradford, which have now been filled with stained glass, completes the series of illustrations of the Passion as originally designed by the artists, Messrs. Powell Brothers, of Leeds, to whom this work was entrusted.

St. Andrew's Church, Yeadon.—A stained-glass window has been placed in this church, illustrating the event in St. Andrew's life which led directly to his martyrdom, namely his conversion to Christianity of Maximila, the wife of a pro-consul, Ægeus. The work is from the studio of Messrs. Powell Bros., of Leeds.

Our Office Table.

Lord Basing, a past-president of the Local Government Board, and the most active promoter of the Public Health Act, 1875, is entitled to be regarded as an authority on sanitary matters. His Lordship in distributing at Southampton the other day a number of certificates of registration, granted by the Plumbers' Company, London, said he felt very pleased that so large a number of those engaged in the trade in that part of the country had obtained the certificates. He had been interested in the subject for some years past, and had attended more than one meeting of the Plumbers' Company. The nation was at that moment in deep anxiety as to the health of a member of the Royal Family, whose illness, for aught they knew, might have been brought about by some defect in house plumbing arrangements, which it was the object of the registration system to prevent and get rid of. The plumbing industry was essential to the health and comfort of dwellers in houses, and he thought it was high time for the nation to be aroused to the fact. He hoped the time had now arrived when certificates of competency on the part of the plumbers would be as much a matter of course as certificates of competency had for some time been on the part of pharmaceutical chemists. Lord Basing subsequently presented several prizes and certificates of merit given by the Plumbers' Company to successful students in the plumbing classes at the Hartley Institute, Southampton.

M. Alphand, the Director of Public Works in Paris, whose death was prematurely announced last week, died from paralysis on Sunday morning, after a fortnight's illness. Born at Grenoble in 1817, he was appointed in 1839 Surveyor of Roads and Bridges at Bordeaux. M. Haussmann, then Prefect of the Gironde, appreciated the ability and activity shown by him in embanking the Gironde, and when himself summoned to Paris he took Alphand with him. Haussmann did much to clear away slums and open new boulevards, and Alphand was his chief assistant, being especially clever in designing public gardens and promenades. He took an active part in the Exhibition of 1878 and the leading part in that of 1889, which he planned, also arranging the fêtes and other attractions. In acknowledgment of the unprecedented success of the latter exposition he was made a Grand Cross of the Legion of Honour, a rank not before reached by a civil engineer. He also succeeded Haussmann last year in the Academy of Fine Arts.

At the last meeting of the Hastings board of guardians, a long and animated discussion took place with regard to the charges of Mr. Tree, of Hastings, as their architect for the erection of the new workhouse. Mr. Tree has been paid £1,450 on account, the outstanding bill being £4,137, making a total of £5,587. At the previous meeting of the board it was objected that Mr. Tree ought only to be paid commission on the original estimate of an expenditure of £50,000, and as a result of a conference with a deputation from the board, a letter was read from Mr. Tree offering without prejudice to reduce his bill by £800. Mr. Perrins moved that Mr. Tree's offer be accepted. He pointed out that a law case would be the alternative to settling the bill, and declared that in a court of law the guardians would stand no chance. This was supported by three other members; but Mr. Reeves spoke in opposition, alleging that Mr. Tree had blundered, and that he should only be paid in respect to a building which cost £50,000. On being put to the meeting, Mr. Perrins' motion was lost by seven votes to twelve. Mr. Chapman next proposed that a cheque be drawn in favour of Mr. Tree for £1,000 on account; but this was defeated by ten votes to seven. Mr. Miller then proposed that they pay Mr. Tree £3,137 to settle his account, being equal to a reduction of £1,000. After an animated discussion, this proposition was also lost by nine votes to ten. Consideration of the matter stands adjourned.

It having been finally decided to retain the whole of Coldbath-fields Prison site for parcel post purposes, the Postmaster-General offered to remove the old prison wall and substitute iron railings from the corner of Calthorpe-street to Oldham-gardens, Farringdon-road, setting them back to increase the width of the street to 60ft., on the condition that the vestry will reset the

pavement and remake the road. Originally it was intended that the entire site of the disused prison should be utilised for industrial dwellings or maintained as an open space, but the sum of £10,000 has been paid to the London County Council in lieu of the reservation of even a part of the land as a recreation ground. It is suggested that more open spaces are not needed in Clerkenwell, and that the £10,000 will be most usefully employed as a contribution towards the erection of a town-hall, on the line of the new thoroughfare from Holborn to the Angel.

Sir J. C. Robinson raises a protest in the daily Press against the proposal of the Totnes town council to destroy the ancient grammar-school which adjoins the picturesque town hall, and to erect in its place a new police-station. The grammar-school, town-hall, and parish church ferm a most interesting group, and while the site is unsuitable for police-station purposes, there being no carriage approach, the grammar-school could, he suggests, easily be adapted to serve as a town museum—an institution which Totnes does not at present possess.

The authorities of the Metropolitan Museum of Fine Arts at New York are endeavouring to bring together a representative collection of casts of architectural subjects and objects of art. The estimated outlay is 100,000 dollars (say, £20,000), of which the museum authorities have about two-thirds in hand, and the work is being carried out in a systematic and thorough manner, which will probably make the New York collection of casts one of the best in existence. A tentative list of the casts desired was drawn up and sent to the heads of all the great museums in Europe for criticism and suggestion, and Mr. Edward Robinson, of the Boston Museum of Fine Arts, was sent over to Europe as the purchasing agent for the New York Museum.

Professor Baldwin Brown is, we notice, appealing in the Scottish newspapers for funds to provide a museum of casts from Greek sculpture for Edinburgh University.

The great height of many buildings already erected in Chicago, and the fabulous number of stories contemplated by the plans of a new Oddfellows' Temple, have brought to a point the agitation against such structures. On one day recently five permits were taken out for the erection of buildings 16 stories high, to cost in the aggregate £600,000. That evening the city council met and directed the Commissioner of Buildings to give no permits for structures exceeding 12 stories, until the question of limiting height is discussed and finally settled.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Royal Institute of British Architects "American Theatres," by H Townsend 8 p.m.
Society of Arts. Cantor Lecture No. 3. "The Pigments and Vehicles of the Old Masters," by A. P. Lawrie. 8 p.m.
Leeds and Yorkshire Architectural Society. Social evening.

Tuesday.—Institution of Civil Engineers. Discussion on "The Sale of Water by Meter in Berlin." 8 p.m.

Wednesday.—Society of Engineers. Annual dinner. Holborn Restaurant. 6.15 p.m.
Society of Arts. "Typological Museums," by General Pitt-Rivers. 8 p.m.

Friday.—Architectural Association Lyric Club. Third Concert. Mona Hotel, Covent Garden. 7.30 p.m.

Mr. Gilbert J. Hunt, of the Borough Surveyor's Department, Bournemouth, was on Tuesday last elected by the Dorchester Town Council to the post of borough surveyor of that town at a salary of £200 per annum in succession to Mr. F. T. Maltby, who has been appointed to Guildford. There were 115 applicants.

The chairman of the Bristol school board formally opened on Monday the new board schools which have been erected in Cheese-lane. The schools will accommodate 639 scholars, and have been built from plans prepared by Messrs. Hansom and Bond (now Jones and Bond), architects, of Clare-street, Bristol. Cattybrook bricks, with terracotta dressings, have been employed in the construction. In the centre of the chief façade are a couple of classrooms, flanked by two gabled projections. The central hall, which is of unusually large proportions, is in the rear, the ceiling being supported by a single column, and covered in by a flat asphalted roof. Surrounding this hall are eight classrooms, with an additional large apartment for infants. The cost, including the site, will be over £11,000.

Trade News.

WAGES MOVEMENTS.

The Arbitrator's Award in the Carpenters' Strike.—In the December issue of the organ of the Amalgamated Society of Carpenters and Joiners, the secretary, Mr. F. Chandler, makes the following judicious remarks on Mr. MacVicar Anderson's award:—"Since last addressing you through the pages of the Monthly Report, the arbitrator has given his decision in respect to the claims of the London joiners, but we cannot help feeling disappointed. In acknowledging, as he did, that the conditions of London work were exceptional and different from those of any other town in the kingdom, in consequence of the great distance which workmen have to travel in order to reach their work and their homes, he omitted to mention the cost incurred each day in travelling to and from their work, and other exceptional circumstances, such as heavy house rents, dear coals, gas, &c., which clearly entitled them to an advance in wages in order to bring up the position of the joiners in London nearer to that enjoyed by our members in most of the large industrial centres of this country. The net result of the award is the establishing of a code of working rules beyond dispute, a reduction in time of 5½ hours for the 16 weeks of winter months, and 1¼ hours in the 36 weeks of summer months—all round, an average reduction from 52½ to 50 hours for the working week. While the rate of pay is unaltered, the rates for overtime are increased, the chief gain being that of 2d. per hour for the first two hours on full days, and double time from 4 p.m., instead of 5 p.m., on Saturdays. New features are the concession of 1s. a day as 'expenses' for men employed over six miles from the shop, the provision of a lock-up place for tools, and a suitable place for meals. In leaving this subject, we desire to express a hope that the arbitrator's award may be faithfully adhered to, and that in a very short time the employers may see the justice and wisdom of supplementing the same by an advance of wages."

Cambridge.—The dispute between the bricklayers of Cambridge and the large local building firms has been amicably settled, and the men resumed work on Monday. The strike has lasted for exactly five months, and has seriously affected the finances not only of the men, but of their trade union. The carpenters are still out on strike, and at present there appears to be no prospect of agreement. The strikers' funds have been augmented from time to time by concerts and entertainments of various kinds, but the non-success of the strike has had a disheartening effect on the men. The masters maintain a firm attitude.

Dunfermline.—For a considerable time past great briskness has prevailed in the building trade in Dunfermline, and there are a number of contracts on hand. In consequence of this briskness, the operative joiners have resolved to demand that their wages be advanced to 7d. per hour on 1st March next. The plasterers are to request an increase from 7d. to 7½d. per hour, and weekly instead of fortnightly payment. Masons obtained a rise in wages some time ago.

Federation of Building Trades Unions.—Steps are, it is stated, being taken to bring about a complete federation of the whole of the trades unions which are concerned in the building trades of London. For some time past a body has been in existence called the "Building Trades Committee," under the secretaryship of Mr. George Dew, and as the necessity for united action amongst all sections of the building trades has been made apparent during the late strike, a conference is shortly to be held at which proposals for combined action will be made. This points to a renewal of the struggle on the part of the building trades next year, which will throw into the shade the recent conflict between the carpenters and joiners and their employers.

Mr. William Mills, Chief Engineer of the London, Chatham, and Dover Railway from its first formation, died on Tuesday at his residence in Clapham-road in his 73rd year.

As a memorial to the Rev. S. T. Green, now rector of Charlton Church, Dover, the foundation-stone of a new church was laid at Dover on Wednesday. The church, which will be the largest in that town, has been designed by Mr. James Brooks, and £6,000 has already been raised towards the cost of the building.

A meeting of the Birmingham Association of Students of the Institution of Civil Engineers was held on Thursday evening at the Midland Institute, the president, Mr. J. Edward Willcox, A.M.I.C.E, being in the chair. A paper was read by Mr. H. Hyatt on the "Testing and Manufacture of Portland Cement," which was followed by an interesting discussion.

WATER SUPPLY AND SANITARY MATTERS.

Bexley Sewers.—The Bexley Local Board has accepted the tender of Mr. George Osenton, of Westerham, for the construction, at a cost of £6,500, of 4¾ miles of pipe sewers in St. Mary's ward, which includes the old village of Bexley. The intended sewers will discharge at several points into the West Kent main sewers, which pass through the district. The tenders for the work ranged from £5,600 to £16,700. Messrs. Alfred Williams and Son, of Westminster, are the engineers.

Oswestry.—The award of Mr. Rofe, arbitrator in the matter of dispute between the town council and Messrs. Jevons and Son, *re* the Penygweley Waterworks, was made known to the corporation on Monday. The claim of Messrs. Jevons was £12,754 3s. 9½d. The arbitrator awarded that the contractors were indebted to the corporation in the sum of £373 13s., which he directed them to pay the corporation on or before December 22, and also that they should allow before that date the corporation to take possession of the materials prepared for the puddle by the contractors. He also awarded that the contractors should be paid the sum of £108 3s. The award was accepted.

The markets committee of the Leeds corporation discussed on Tuesday a proposal to roof-in a portion of the uncovered ground lying between the entrance near the George Hotel and the Fish Market. The borough engineer (Mr. T. Hewson) laid before the committee two plans, one founded on the same principle as the roof of the new Midland Station at Bradford, and the second on that of the covered market at Newcastle-on-Tyne. After discussion, the committee resolved to adopt the first-mentioned plan, which involves an expenditure of about £4,000.

The designs of Mr. Thomas W. Cubbon, architect, of Birkenhead, have been adopted for new Wesleyan church and school buildings about to be erected at Ambleside in the English lake district. The church will seat over 400 adults, and the school has accommodation for 300 children, in addition to which extensive class-rooms are provided. The buildings are Late Gothic in character, and are faced externally with local blue stone, relieved by yellow sandstone dressings.

Holloway's Pills increase the appetite, strengthen the stomach, cleanse the liver, correct biliousness, purify the system, invigorate the nerves, and reinstate sound health. The enormous demand for these Pills astonishes everybody, and a single trial convinces the most sceptical that no medicine equals Holloway's Pills in its ability to remove all complaints incidental to the human race.

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

APPERLEY BRIDGE, YORKS.—For the erection of a church at Apperley Bridge, near Leeds. Messrs. Jowett, Kendall, and J. H. Bakes, M.S.A., Claverley Chambers, Victoria-square, Leeds, architects. Quantities by the architects:—
Accepted tenders—
Mason's work:—
Obank, T., and Sons, Idle £1,507 0 0
Joiner's work:—
Obank, T., and Sons, Idle 443 0 0
Plumber's and painter's work:—
Higginbotham, A., Idle 206 0 0
Plasterer's work:—
Hollings, F., Idle 91 15 0
Slater's work:—
Thornton, T. and A., Eccleshill ... 123 18 0
Total amount, £2,371 13s.

BISHOPS HULL, SOMERSET.—For building new schools, master's residence, boundary walls, &c., for the Bishops Hull School Board. Mr. George C. Strawbridge, Taunton, architect:—

Morse, J.	£2,375 0 0
Spiller, H. J.	2,360 0 0
Sloman, W.	2,300 0 0
Derham, S.	2,150 0 0
Harrison, W.	2,075 0 0
Mountsephent, J.	1,985 0 0
Rendell and Son (accepted) ...	1,949 0 0
Spiller, A. J.	1,940 0 0

BRISTOL.—For cleansing, and watering, and removing ashes throughout the district, for the city council, during one year:—
Shellard, J. and E., Bristol* ... £20,030 0 0
* Accepted.

BRISTOL.—For paving Redcliff street with wood, for the city council:—
Wilkins, G. H. (accepted) £2,556 2 9

CARDIFF.—For alterations and additions to the Royal Oak hotel. Mr. C. C. Jones, Cardiff, architect:—
Lewis, Cardiff (accepted provisionally).

DUNDEE.—For completing the duplication of the Lintrathen water main, by laying a second pipe between Pitnappie and Dundee, for the Dundee Water Commissioners:—
Accepted tenders:—
Cast-iron pipes:—
Stewart, D. Y., & Co., Glasgow ... £18,183 0 0
Excavating work and pipe laying:—
Mackay, G., and Sons, Dundee ... 6,999 19 8
Valves:—
The Glenfield Co., Kilmarnock ... 181 0 0
Total, £25,364 0s. 8d.

DUNSTABLE.—For alterations to the North-Western Brewery, for Mr. B. Bennett. Mr. W. J. Pearson, Market-hill, Luton, architect:—

Cheshire, J.	£217 10 0
White, G. H.	178 0 0
Robinson, J.	161 0 0

EBBW VALE.—For alterations and additions to Catholic Schools, for Rev. F. Fritz. Mr. C. C. Jones, Cardiff, architect:—
Davis, Ebbw Vale (accepted).

HALIFAX.—Two villas, stable, greenhouse, gates, and boundary-walling, Francis-street, Halifax. Mr. T. Lister Patchett, Halifax, architect:—
Accepted tenders.
Excavator, mason, and bricklayer:—
Naylor, Edwin.
Carpenters and joiners:—
Greenwood, F., and Son.
Slaters and plasterers:—
Blackburn and Davenport.
Plumbers and glaziers:—
Sutcliffe, W., and Son.
Electric lighting and bells:—
Sunderland, J., and Co.
All of Halifax.

HALIFAX.—For the execution of various work in connection with the new arcade and shops, for the Corporation. Messrs. Leeming and Leeming, of London, architects:—
Carpenter's and joiner's work:—
Townsend, G., and Son (accepted) £2,940 0 0
[Previously accepted tender from Fielding and Bottomley, withdrawn.]
Excavator's, mason's, and bricklayer's works:—
Birkby and Sons, Wyke (accepted) £6,520 0 0
[Previously accepted tender from Charnock and Sons, withdrawn.]

HALIFAX.—For constructing an intercepting sewer in Queen's-road, for the corporation:—
Tyson, G. and H. (accepted) ... £2,919 0 0

HIGH BROOMS, TUNBRIDGE WELLS.—For the erection of a licensed house for Messrs. Jude, Hanbury, and Co:—
Strange and Co. (accepted) ... £1,711 0 0

LIVERPOOL.—For laying electric mains to the Walker Art gallery, for the city council:—
Liverpool Electric Supply Co. (accepted) £80 0 0

LIVERPOOL.—For supplying and fixing new gates to the Haymarket extension, for the city council:—
Raffle and Campbell (accepted) ... £75 10 0

LONDON.—For two iron escape staircases at the Industrial Schools, Plashet, Upton Park, E., for the guardians of the parish of St George-in-the-East. Messrs. Wilson, Son, and Aldwinckle, 1, Victoria-street, S.W., architects:—

Holland, J.	£269 0 0
Nightingale, B. E.	255 0 0
St. Pancras Ironworks Co.	217 0 0
East Surrey Iron Works	197 10 0
Constructional Ironwork Co. ...	177 0 0
Cole, F. W. (accepted)	159 10 0

LONDON.—For alterations to basement of No. 64, Oxford-street, W., for Messrs. G. Rowney and Co. Mr. W. J. Ebbetts, F.R.I.B.A., Savoy House, 115, Strand, W.C, architect:—

Smith, W.	£141 0 0
Baylis, H. (accepted)	135 15 0

LONDON.—For rebuilding No. 26, Finsbury-square, E.C., and other works in connection with the enlargement of Buecker's hotel, for Mr. G. Hohly. Mr. J. Groom, 1, Broad-street Buildings, Liverpool-street, E.C., architect. Quantities by Mr. H. Theobald, F.S.I., 87, Finsbury-pavement, E.C.:—

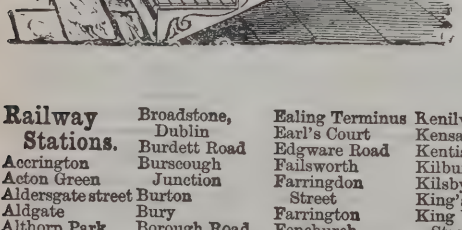
Woodward and Co.	£3,573 0 0
Gregar, W., and Son	3,567 0 0
Lawrence, E., and Sons	3,437 0 0
Stimpson and Co.	3,360 0 0
Mattock Bros.	3,133 0 0
Holloway, H. L., Deptford* ...	2,973 0 0

*Reduced estimate accepted, £2,820.

LOWESTOFT.—For new premises for Mr. E. Lawrence, fish merchant:—
Newson, W. (accepted).

LUTON.—For the erection of new medical institute, doctor's residence, stabling, &c., Waller-street, for the trustees. Mr. W. J. Pearson, Market-hill, Luton, architect:—

Saunders, J.	£2,916 6 0
Smart, G.	2,800 0 0
Parkins, D.	2,798 0 0
Pryer, G.	2,780 0 0
Dunham, G.	2,760 0 0
Wright, C.	2,547 0 0
Kingham, G.	2,534 0 0
Neville, T. and E. (accepted) ...	2,386 0 0



LUTON.—For two residences, London-road, for Mr. J. T. Needham. Mr. W. J. Pearson, Market-hill, Luton, architect:—
Neville, T. and E. £900 0 0

HAWKSLEY'S PATENT TREADS.

Proprietor & Manufacturer: J. WESTWOOD, Jun.

NAPIER YARD, MILLWALL, E.

Telegraphic Address—"Westwood," London. Telephone No. 5065.

Recommended for durability, simplicity, firm footing, elasticity, and are perfectly noiseless; they excel lead, oak, teak, or stone; applicable to wood and iron staircases, new and worn-down stone stairs, spiral and other staircases, footpath flaps to cellars, covers for drains and coal-cellars, flooring for public buildings and aisles of churches, &c., &c.—The best and most durable Tread or Step yet invented.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXI.—No. 1928.
FRIDAY, DECEMBER 18, 1891.

BATH MUNICIPAL BUILDINGS COMPETITION.

ACTING upon the recommendation of Mr. W. Young, F.R.I.B.A., the assessor, the City Council of Bath have awarded the three premiums of £100, £75, and £50 respectively to Mr. J. M. Brydon, of London, for his design marked "Adelphi"; to Messrs. Burgess and Oliver for design "Lex"; and to Mr. T. B. Silcock, of Bath, for design marked "Wood." As to this selection opinions vary, as may be inferred from the remarks and debate which followed the reading of the report of the Municipal Buildings Committee at the meeting held last Friday. Owing to the fact that a considerable portion of the design facing the High-street is an incorporation of the old Guildhall as a central feature, the composition, as an architectural whole, lacks almost necessarily one of the chief conditions of a successful design. The requirement of retaining the old building as a centre has materially restricted the architect's freedom: it imposed the necessity of making the new wings agree in character with the present building, and it also struck the keynote of the entire façade and its fenestral arrangement. A further drawback to success is the rather acute angle between High-street and Orange-grove, which a large number of the competitors, including Mr. Brydon, has followed upon the line laid down in the plan of sites. This plan showed a bold curve or quadrant connecting the High-street with the Orange-grove frontages. Many of the designs adhere to this line as if no improvement were possible, while a few adopt the more architectural arrangement of making the angle at the corner square by setting the building a little within the line as in the cases of "Lex," "Three Horse-shoes," and "Progress." The great length of the main façade of the new structure which, including the Guildhall and art gallery, will be about 340ft., makes it important to break up the front by variations in the heights of the new wings and by projections or recesses in the frontage. These considerations are, we think, important in the choice of a design for a prominent site, like that selected, so close to the Abbey church. The six designs chosen by the assessor for consideration included "Adelphi" "Lex," "Wood," the three premiated designs—and "Simplicity of Plan," "Progress," and "Guildhall," and we will first make remarks on these. Two main departments had to be provided, the Municipal and Police, with their attendant rooms.

"Adelphi," by Mr. J. M. Brydon, has the merit of complying with the conditions in many particulars. The new wings are well planned; the corridors along both blocks are arranged at right angles instead of obliquely. These are well lighted at the ends and by side areas. At the angle of corridors is a spacious hall, with staircase, for municipal purposes, approached by the entrance-hall at the corner of High-street and Orange-grove. The author's endeavour to "infuse the spirit of the old work into the new" has been fairly attained, and, as the assessor observes, the elevations are quiet and dignified, and in harmony with the Guildhall front, the ordinances and wings of which have been repeated in the square blocks which terminate the two elevations at the quadrantal corner. The whole façade to the High-street, including the art galleries' wing on the north side of Guildhall, is simple and devoid of expensive detail. The author joins two rather low recessed wings of five window bays to the old front; at each end of these he repeats the plain astylar portion of the old building, but surmounts them by octagonal cupolas, a rather awkward-shaped quadrant (having an upper order of three-quarter columns repeating the old columnar part of the Guildhall) forming the corner at each end. The corner square towers and quadrants agree in level with the cornice and parapet of the Guildhall. This arrangement produces a somewhat abrupt termination in the main façade, which is partly mitigated by the cupolas which accent the corner ends. In the Orange-grove front the elevation is well managed. A low cupola, or domical roof, is added to the centre of Guildhall, which certainly adds to its importance, and counteracts the greater height of the new wings. Referring to the plans, the author places the new court and council chamber at the back, so as to avoid the noise of traffic; the police-court, on ground floor, 42ft. by 32ft., is approached by front and side corridor, and is lighted in rear. Along the front, next to Guildhall, are arranged in order the female witnesses' room, a short corridor for light, male witnesses', justice clerks', and solicitors' rooms; these occupy the whole wing up to the corner. The Orange-grove return has the barristers' retiring room, near hall, and the city engineer's offices, lighted in front and towards the area. The old sessions court is retained, the new court is near it, separated only by the jury and magistrates' room. The old principal staircase remains, and gives access to the council chamber on the upper floor. In the plan of first floor the author has skilfully connected the new council corridor, which is top-lighted, to the old banqueting-hall by a circular domed lantern, and vestibule with ante-room between hall and council chamber. On the street side of this corridor is the mayor's parlour, 26ft. 6in. by 17ft. 6in., and a committee-room, 27ft. by 17ft. 6in. The whole circular corner and its wings is devoted to the town clerk, whose offices are conveniently placed near the new municipal staircase of the corner; the shape of the clerk's general office forms a quadrant, the inner angle having an entrance and counter. The return wing is devoted to the treasurer's offices. The public entrance and stairs at this end of corridor near the new road to Market, gives access to the galleries of Court and Council Chamber, and the lavatories near are convenient. The second floor contains spare rooms, and in basement are the office of inspector of weights and measures, heating-chamber, and spare rooms. An underground passage is shown between police offices and new buildings. The sections of this design show circular ends to council chamber with segmental ceiling, and air-pump ventilator over. One detail to which objection may be made is the great height of sham walling and parapets to the front elevation, which is not less than 12ft. This expedient was apparently adopted to give height to the new wing, but it is not desirable, and might have been avoided by a higher roof. The sculptured frieze in the quadrant looks rather out of place. In the Conditions, a lift was to be provided from kitchen in basement to first floor, for dinners in the banqueting room, but this has been omitted. It would have been better if the treasurer's department had been on the ground floor. The estimate is £22,500, including heating and ventilation.

"Lex," by Messrs. Burgess and Oliver, is one of the four designs which has shown a square-setting back at the corner, and a more architectural treatment of the return front; the loggia quadrants to the angle block facing Orange-grove, and the well-massed corners are ageeable. The magistrate's court, 38ft. by 30ft., is next the old Guildhall in the rear, approached by front corridor, with judge's and magistrate's retiring room next it. The justices', clerks', barrister, and solicitor's room are on the street front. The return corridor gives access to the sessions court, 45ft. by 34ft. at the end of Orange-grove, with a jury room at the end which is semicircular, and covered with a half dome, which makes a good feature. The public entrance to court is on the Grove side, with witnesses' room near. The main entrance is at the end of High-street, next the corner, and in a line with return corridor. The square arrangement of the walls and corridor, and the lighting are satisfactory. On the first floor is the council chamber, 53ft. by 30ft., over the magistrate's court, with retiring room. In front are the mayor's private room and town-clerk's offices. The second floor has the engineer's offices; the basement, the weights and measures testing rooms and surveyor's clerks in front. The plan thus provides for two new courts, the old sessions court being converted into treasurer's offices; but the connection between old and new buildings, and the lighting of front corridor, are imperfect. The old staircase is kept, and leads to the council chamber above; but we find no separate entrance to the magistrates' court, or to the council chamber over. The engineers' offices on the second floor are rather inconvenient for access. Another objectionable point of plan is the location of the lavatories and w.c.'s at the main corner. The author has not preserved so scrupulously the style of the old work, but has designed his elevations with more individuality. The cost is estimated at £20,000, assuming a price per cubic foot of 10d. from the top of concrete. Mr. Young estimates the design at £22,500.

"Wood" (otherwise "Beau Nash") by T. B. Silcock, has a well-managed corner entrance by a quadrantal portico, with spacious hall, top-lighted and galleried on upper floor level to main corridor, and divided by columns into three avenues, giving access to public court, 45ft. by 32ft., in rear, with jury and magistrates' rooms at the end next Guildhall. In front of corridor are justice clerks', solicitors', and barristers' rooms. The treasurer's offices, cloak, and inquiry rooms are in the Orange-grove side. The first-floor plan shows the council-chamber over the court, 45ft. by 32ft., having apsidal bay for mayor's parlour and town clerk's rooms along the High-street front. The author retains the old staircase. The lighting of the front corridor is scarcely sufficient, but the large inner hall admits direct light from the top. The second floor gives accommodation to the city architect in front and surveyor in side wing. A lantern roof is shown over council-chamber and hall. The elevation shows corner blocks of same height as Guildhall, with order of engaged columns on a basement. The centre and corner blocks are connected by low buildings of Italian character, but the skyline of masses is level and unrelieved. Emblematical groups of figure sculpture are placed on the angles. Elaborate detail is shown in two clever sepia sketches of staircase and public hall, which latter is two orders in height, and the author proposes marble and carving in the latter. The estimate given is £24,353. The author has made a few good points. He has taken advantage of the fall of ground at Orange-grove end, to give direct access to basement as well as ground floor. The quadrant-shaped portico, with three wide arches between Doric columns, is skilfully joined to the circular-ended hall, lighted by a domed lantern, with gallery on first-floor level, which hall would make a grand centre, though rather costly. The staircase to first-floor landing on each side of entrance is skilfully managed. A passenger lift adjoining porters' room connects all the floors, the workmen's entrance is useful, and the police-court and council chamber are well

placed with the necessary rooms and offices in connection. The fittings to the court are well planned, and the junction between old and new buildings skilful. The author has kept in view the traditions of Bath architecture, and the style of the two Woods, with its quiet, Classical feeling, has been preserved. The lower story is quite plain, while the upper story of the new wings and quadrant is adorned by an order of three-quarter columns, with square-headed windows, a cleverly-drawn detail of which is exhibited. The low-connecting blocks shown on the plans we reproduce are pleasing breaks.

"Progress" has also a right-angled return with an octagonal hall at the corner. The front elevation is columnar, joined to the old building by a low screen or corridor. The ground-plan comprises magistrate's, witnesses', barristers', and solicitors' rooms in the Orange-grove block, and a sessions court near old building. There is a spacious rectangular staircase and hall at the corner of corridors. On the upper floor is the council chamber adjoining the banqueting hall, with semicircular seats, entered by a wide front corridor well lighted from the street; the town clerk's offices are on the Grove front, with treasurer at one end, and a mayor's parlour in the octagon corner. The corner is surmounted by a kind of double dome. The city engineer occupies the octagon room and side wing on top floor. "Simplicity of Plan and Harmony of Elevation," shown by two schemes, has the usual quadrant corner, rather abrupt in curve. The judicial rooms are in front; two entrances on quadrant, one for public to police-court, and the other to offices, are shown. The corridors are awkward at their junction with lobby. The police-court is in rear of front block, next the old court, and the city engineer's and treasurer's offices are placed at the end of return wing. The first floor has council chamber over the court, with mayor's, committee, and retiring rooms in front, the town clerk being relegated to the Grove block. The elevation is skilfully grouped at the corner, the quadrant stopping against projecting blocks of tetrastyle design, with a flat cupola at the intersection. The connecting wings are low, and have recesses or loggias with columns, and a sculptured figure frieze is introduced in the fronts. "Guildhall" has also a circular corner, which is occupied by the police-court. The justices' clerks and staircase hall in front, with witnesses' and barristers', &c., rooms behind corridor, and engineer and treasurer in side wing. The corridors appear deficiently lighted—a fault common to many others. The upper floor has the council chamber over the court at the corner, with the mayor's rooms in front and the town-clerk in side wings. The elevation shows the Guildhall flanked by towers and cupolas. The author repeats the Guildhall façade in the side wings, making three blocks; the circular corner has an order of columns engaged.

We can only briefly refer to the remaining designs, and amongst them the design with motto "Three Horseshoes," by Major Davis, the city architect of Bath, deserves a more prominent position than has been given it for merits of plan and elevation. To avoid the unsightly curve and angle, which has been so generally followed, the author has returned his building at right angles for some distance, and introduced between the two façades at the corner a semi-octagonal entrance hall containing the main staircase, which is carried up and terminated by a cupola. The art-gallery wing is also treated in the same manner. The main façade joining the present Guildhall is set back from that building; but there is a bold return at the octagon tower at each side. The line of building in the rear is also varied. From the east angle of Orange-grove front the building returns at right angles, giving a larger area for the offices and courts. The High-street façade is well broken by low wings on each side of old building, and the arrangement of breaks in the upper story of front, with arched rustication below, relieved by coupled insulated columns forming the piers, is simple, and harmoniously connects the old and new parts. The elevation and details shown in the perspective do inadequate justice to the design. The author provides a new sessions court near the old building, and converts the present sessions court into judicial and town clerk's offices—a very desirable arrangement to our mind. A spacious portico entrance and vestibule on the approach road to market gives a useful access to the quarter-sessions court and gallery of petty sessions, each having its own corridor. The former court is at the east end of Orange-grove, 41ft. 6in. by 31ft., well lighted to the Grove, with accommodation for the grand jury and the petty jury, and a registrar's room for undefended cases. The witnesses' waiting and jury rooms are well placed, lighted by an area; and along the front corridor are the rooms for magistrate, solicitors, barristers, and recorder. The council chamber is over the petty sessions court, well lighted by clerestory windows above corridor, with waiting-room, serving-room, lavatory. Near the council room, and fronting High-street, are robing-room and city engineer's offices, the return block being given to the treasurer. A gallery is shown over the waiting-room of the council chamber. The author has kept within the boundary-line of plan, instead of encroaching beyond it, as in the second premiated plan. "Queen Elizabeth," a well-drawn set of plans, has a canted corner, with pediment and lofty tower over. The new wings have cupolas, and the style of the old building is fairly preserved, if we except the arched entrance to market, with corresponding blank arch on other side of Guildhall, which joins the wings to that building. The council chamber on first floor is placed lengthwise with High-street front, and lighted therefrom, and has an apsidal end; the police-court, on ground floor, is near the present Sessions Court, with Justice's room between. "Bath Tradition" is quietly treated. The upper story of wings has an order of columns, and these are joined to square ends, which repeat the old building, and of same height. On the Grove side is a pedimental block, and the corner is square and broken. The police-court and council-chamber block faces the Grove. The plan of corridors and rooms is well studied. "Fortuna" has a clever sepia perspective, but rather too broken and redundant at the corner. A circular entrance hall between the façades, surmounted by a cupola, is a feature. The front wings are broken in outline, and are overpowered by the Guildhall, and the block of court and council chamber which rises to the same level. The circular corner and its abutting blocks are arranged like a "rule-joint." "Bonâ Fide" is too Italian: the round-arched windows of new façades do not harmonise with the Classic simplicity of the present Guildhall. The circular corner is composed of three arches abutting against square columnar blocks on each front, leading to a large hall at angle of corridors with staircase in the axis of angle. The court and council chamber are placed in the order usually adopted, and there is some skill shown in the arrangement. "Plan" has the wings connected to present building by wide arches, one forming approach to market, and with corner turrets added to Guildhall carried up as cupolas. The style of the new building hardly agrees with the old. The junction of quadrant and Grove front is abrupt, and the rooms are cut obliquely. "In Unison."—There are three pediments towards the High-street, with circular corner and pediment on return front. The council chamber is in front on first floor. "Adan" has an elevation showing low wings and dissimilar fenestration from the pres building; the pilasters are out of sca and the author encroaches in making pr jections at angles of Guildhall. The circul corner looks abrupt. The new court is rear of Grove wing, and low roofed, and t council chamber faces the High-street, first floor. "Prince Bladud" flanks Guil hall by lofty towers; the niches for statu between windows of town clerk and mayo rooms at corner look out of place. The pl is weak, with council chamber at end Grove wing. "Mind and Work" is faul in the lighting of corridors. The lines elevation continue the same level as the of the present buildings, with recess columnar wings stopping against squa towers pronounced by cupolas. The borou court faces Orange-grove, and is pediment "Tradition of Bath," "Touchstone," a "Cross in Circle" are below par.

It is a pity the committee intrusted wi this competition had not made up the minds as to what were essential point instead of having been obliged to modi the Conditions. The question as to bounda has been differently understood: some ha adopted a "give-and-take" line, wh others have kept within the lines of t block plan. Some have gone up to t limits of new entrance to market, wh others have adopted the boundary show Other differences of interpretation are four in respect of accommodation to be provid in the basement. A well-considered set conditions should render any further info mation unnecessary. The line of corn adopted, and the angle of return, are unfo tunate for the architectural treatment; a a more satisfactory plan would have been have left competitors free to make a righ angle return towards Orange-grove.

GOLD MEDAL AND OTHER PRIZ WORKS AT THE ROYAL ACADEMY

THE erudite and interesting address d livered by Sir Frederick Leighto P.R.A., on the occasion of presenting t gold medals and other awards at the Roy Academy last week will be found report in another part of our issue to-day. T following is a complete list of the prizes a prize winners:—

Historical painting, gold medal and tr velling studentship (£200), Ralph Peaco Landscape painting, Turner gold medal a scholarship (£50), Francis Joseph Mackenz Landscape painting, Creswick prize (£3 Emily Louisa Long. Painting of a figu from the life (open to male students onl silver medal, 1st, George Spencer Watso silver medal, 2nd, Reginald Arthur. Pai ing of a head from the life, silver med 1st, Henry Lawrence Dell; silver medal, 2 Gerald Edward Moira. Painting of a drap figure (open to female students only), silv medal, 1st, Helena Maria Swaffield. Carto of a draped figure, silver medal and pr (£25), Herbert Arthur Horwitz. Design monochrome for a figure picture, Armita prizes 1st (£30), and bronze medal, P Raphael Montford; 2nd, (£10), Marion Cla son. Design for the decoration of a porti of a public building, prize (£40), P Raphael Montford. Set of six drawings a figure from the life (open to male stude only), 1st prize (£50) and silver med George Spencer Watson; 2nd, (£25), Fran Joseph Mackenzie; 3rd (£15), Lawre Edward Koe; 4th (£10), Gerald Edw Moira. Drawing of a head from the life, sil medal, 1st, Lewis Christopher E. Baum silver medal, 2nd, Katherine Mary Wil Drawing of a statue or group, silver med 1st, Katharine Mary Willis; silver me 2nd, Evelyn Caroline E. Pyke-Nott. Co position in sculpture, gold medal

velling studentship (£200), Paul Raphael ntford. Set of three models of a figure m the life, 1st prize (£50) and silver medal, drea C. Lucchesi; 2nd prize (£20), Paul phael Montford. Model of a design, 1st ze (£30), Andrea C. Lucchesi; 2nd prize 10), Paul Raphael Montford. Model of a st from the life (open to female students ly), silver medal, 1st, Jane Adye Ram; ver medal, 2nd, Edith Bateson. Model of statue or group, silver medal, 1st Edith teson. Design in architecture, gold medal d travelling studentship (£200), Alfred nry Hart. Set of architectural drawgs, silver medal, 1st, Francis Edward ard. Set of architectural designs (upper ool), prize (£25), Alfred James Edwards. t of drawings of an architectural design wer school), prize (£10), Henry Ernest rby. Plan of a building, prize (£10), nry Ernest Kirby. The Landseer Scholarps in painting and sculpture, of £40 a ar each, tenable for two years, given for best work done in the examination for ssing into the second term of studentship, re awarded, in painting, to Gerard Edward ira, and in sculpture to Paul Raphael ntford.

We are glad to note a very considerable provement in the architectural students rk this year at Burlington House, although this remark really only applies the designs and drawings contributed those students who competed for the ld medal. We understand that this mingly partial improvement is due to fact that much of the class work was qualified from competition for the prizes, account of many students having failed attend the required number of times ring the year. Hitherto, the rules in this pect have been very stringent, and the ndard of attendances has been so high, that ly exceptionally favoured students were le to comply with the regulations. This quirement has recently been qualified so to be better adapted to pupils having nerally some other engagements. With gard to the designs submitted for the gold dal, it is clear that the best men of the ar have wisely concentrated their chief orts in this competition. The subject was a town mansion, situated on a wide, roomy e, and the requirements stipulated that cial accommodation should be provided the reception rooms of the house for the per display of sculpture, paintings, and rks of art. The idea was a favourite one the late Mr. Edwin Long's, and the aim he d in view was the erection of mansions the rich, in which large pictures could be equately seen, other than in galleries cially devoted to the purpose. Few of e competitors have realised this intention, ing that in some of the best dens much of the available space is upied by galleries intended to be apart for sculpture and paintings, ereas the provisions should have been de in the chief apartments of the dwellg. This, to some extent, accounts for the oice, which has been made in awarding e prize to Mr. A. H. Hart, who, perhaps, the only competitor who has followed the structions in this leading particular. The tely dignity of his plan is commendable, ough the entrance hall looks as if it would cessarily be dark, and the most does not pear to have been made of the interior rt. In elevation the composition is highly nate, in a Belgian style of the Renaissance, ving built up elaborately treated dormers rmounting the side pavilions, so to speak, the elevation. A heavy oriel projects in tween over a semicircular entrance portal, d above this, below the eaves, is an arched ess, increasing a restlessness of effect. assive balconies project over the groundor semicircular arched windows right and t of the entry, and large mullioned ndows above afford ample light to the main rooms. The columns dividing the fenestration of the two main floors are of varied height, differing so greatly as to suggest an absence of scale, an effect which is intensified by the overbearing weight of the heavily-treated main cornice. The Greek-like refinement, too, of the figure sculpture in the panels over the first floor windows adds to this absence of harmonious treatment. The composition looks better in elevation, and on the whole certainly deserves commendation both for good drawing and skill in design, though the success which marks the work is marred in the way we have indicated. The set of plans distinguished by No. 249 may be said to more nearly accord with our ideas of what a new town mansion should be like than the prize design, but then the author has devoted too much space to mere gallery accommodation, which in this case is an objection fatal to his success. The hall is well lighted, and on one side of the internal court a conservatory is very prettily treated. The plan generally is eminently picturesque, with original and admirable architectural detail, somewhat French in feeling in the elevation of the quadrangle. Much of this work in reality would, however, be hidden from view. The front elevation is broadly treated in a manner made familiar by Mr. Ernest George. The ornamentation is well concentrated, and being confined to the central part of the façade is set off to advantage by the wide, simple bays in the side pavilions, over which are Belgian-like gables flatly treated. The central porch scarcely harmonises with the rest of the front, and over it is a clever loggia treatment in two stages. We understand the author of this design is Mr. Alexander Mackintosh. "Royal, Rich and Wide" is the motto of the next design, No. 248, shown by a well-tinted sepia perspective and outline elevations. A long open court marks the plan, which has several points of merit. The elevation is rather ponderous composition in a Classical mode with a florid frieze somewhat overelaborated with swags, but rich in effect. Between the tall windows of the first floor are a series of niches with full-length statues, and the whole façade is crowned with a handsome cornice surmounted by a hipped roof broken by square dormers. The porch projects too much, and the columns at its angles are characterless and ineffective. Taken as a whole, the design shows the power of commendable reserve. No. 247 is a commonplace design, reminding one of the new building for the College of Preceptors in Bloomsbury-square. The plan is of a regulation type, and the hall is evidently a dark arrangement. Over the centre is a high mansard roof, with a florid cresting. No. 246.—This design has two courts, and is a very picturesque arrangement, both on plan and in elevation. Here the solids and voids are boldly conceived and well balanced, but lacking in harmony of parts. A wide sprawling gable crowns the centre, and two tall fantastic lead-covered turrets flank the recessed part in the middle of the front, and terminate two quasi towers at the ends. Tall bay windows light the main rooms. The ground floor is furnished with a long range of small lights, quite out of accord with the rest of the front, and the entrance door is heavy and ugly. Design No. 250 has a low, wide Dutch-like façade, better adapted to a suburban site, or for a thoroughfare like Fitz John's-avenue at Hampstead. The interior is in no way suggested by the front elevation, which is more fitted to a ladies' school. Inside the hall is over-columned, and much room is wasted on a large interior court. The apartments, too, are small compared with the other designs. The view is cleverly delineated in outline, tinted with Indian ink, and the author is Mr. Charles Spooner. There are two other designs which call for no particular remark. Only one set of drawings were sent in for the Silver Medal for measured drawings. The subject represents Cockerell's Hanover Church, in Regent-street, and is shown by a careful series of drawings by Mr. F. E. Ward. Mr. Paul Raphael Montford wins not only the Gold Medal for sculpture this year, but four other prizes. His prize design for the decoration of a public building is, without doubt, the best among the six submitted. The subject chosen is "St. Augustine preaching Christianity in England," and the large cartoon accompanying the general coloured design represents one of the subsidary figures, and not the great preacher himself. As a composition the design has much merit, but, historically speaking, the detail will scarcely bear examination. King Ethelbert and Queen Bertha are seated in an Italian-like piazza to the left of the picture, and St. Augustine is shown in full archiepiscopal robes in the midst of the cortile, surrounded by a procession of choir-boys and clergy grouped really for picturesque effect, but quite devoid of ecclesiastical propriety. The colours, too, in pinks, ambers, yellows, and pale blues, have been dictated mainly with a view to harmony of tone and gradation of sober colouring. Four of the other designs more correctly represent St. Augustine in his monk's habit, but one and all are straggling in design and wanting in composition. The Cartoon Competition this year is won by Mr. H. A. Horwitz for his "Mark Antony showing Cæsar's mantle to the people: 'Look, in this place ran Cassius' dagger through.'" The figure is vigorously drawn, and is shown against a white ground. There were only two other competitors for this prize. Mr. Montford's gold medal sculpture group represents Jacob struggling with the angel. It is a spirited and particularly clever design, very picturesque in outline, with the outspread wings of the angel grandly treated. There were five other designs. The drawings submitted from the architectural schools call for no comment.

EMPLOYERS' IDEAS OF VALUE.

EMPLOYERS who are fond of denying their liabilities to their professional advisers, and who go to law rather than acknowledge their indebtedness, will do well to read the case in the Queen's Bench Division, which has been decided by Mr. Justice Hawkins, and reported in our last issue. The plaintiff, Mr. Mansbridge, a builder, sued Mr. Woods, defendant, for balance due on account of a house built for him at Bellagio. As usual, the defendant alleged that the contract had not been properly carried out, and charged the plaintiff with collusion with his architect. The defendant agreed to refer the matter to arbitration, and a quantity surveyor was appointed by the President of the Institute of Architects. The result of the arbitration was that the referee valued the house at a much larger sum than that repudiated by the defendant. Instead of paying the balance to the builder of £100 due upon the contract, he actually, by the judgment given upon his own action, had to pay £377, the difference between the contract price and the referee's estimate, with costs, including those of the referee. Mr. Justice Hawkins, in his judgment, said the "defendant having agreed to refer the question, he must abide by the result, whether favourable or not to him." The estimate made by the referee was, of course, on "measure and value," which amounted to £1,702, whereas the contract price was £1,425. The plaintiff only claimed the balance of £100 on the latter amount, or as an alternative £185, estimating the work according to the referee.

The result of this case is a warning to those litigious building owners who are always imagining that they are being fleeced.

The defendant alleged that the contract had been improperly carried out; but on what grounds he did so does not appear in evidence. It is certain the defendant could not have known very much about building, or he would not have charged the contractor and architect with collusion. Yet this allegation appears to be a very common mode of action when no explicit fault can be pointed out in the building. Perhaps it was an effort to obtain some abatement which many people after they have made a contract seek to do, thinking that a contract price has been framed for the purpose of being afterwards reduced. The idea of a discount is often entertained by those who in their commercial transactions are in the habit of making bargains, but the system is not tolerable in building contracts. The judgment in this particular case ought to be a useful lesson to employers who have no evidence of defective workmanship or materials, but who, to carry their point, make allegations that cannot be proved or justified.

The contractor, in this instance, was apparently a substantial gainer by the employer's action, for he was actually paid twice the amount he asked for. There are few contractors, we imagine, who would not prefer to accept "measure and value" prices for their contract if they had the opportunity. Many contractors on this system of valuation would be gainers of from 10 to 20 per cent. We should say, after reading this decision, employers will be shy of refusing to pay the balance on a contract without very sufficient reasons. Architects and builders will, of course, gather some comfort from the judgment; at the same time it will serve to draw attention once more to the sort of charge employers are apt to make when things do not go exactly as they like. The charge of collusion and fraud is one generally brought, without grounds, against architects; but we may imagine a case where the architect has given a final certificate to the builder, which the employer thinks is premature or before the contract has been fully carried out. Reasonable argument is of no avail, and the certificate is granted, much to the dissatisfaction of the employer, who refuses to honour the certificate. The contractor sues the employer, who has no alternative left than to censure his architect, and allege collusion on his part with the builder. But this charge has to be proved, and can only be confirmed by measuring the work executed to see if the value made by the certificates can actually be made out in the building. The withholding of a certificate, or unfairly making one, has been held to be sufficient to enable a contractor to bring an action against the employer, and to recover the full contract price, with extras, and in like manner the same principle would apply to an architect if he gave a certificate to the contractor without having satisfied himself of the condition of the work performed, or had given certificates which showed more money expended by the contractor than was really the case. It is at least conceivable for an architect in a large undertaking to make a mistake, or to give a certificate without ascertaining the actual amount of work done, and in this way to render himself liable to a charge of this sort; but such a mistake rarely occurs, especially when the work is measured at intervals.

We hear of a great many disputes arising from the over-confidence of building owners in their own opinions; they even obtain price-books and examine the priced quantities when those documents are accessible. Fortunately, the architect has the alternative of arbitration, and can prove his certificate, if need be, by "measure and value"—a process of estimation which, if the work is well done, does not generally err on the side of defect.

SIR FREDERICK LEIGHTON ON FRENCH ARCHITECTURE.

THE President of the Royal Academy delivered his biennial address to the students of the Academy Schools on Thursday evening in last week, the subject being a continuation of that dealt with in Sir Frederick's previous addresses—the relationship of the art of a country to its surrounding conditions. The addresses of 1887 and 1889 were devoted to the Italian and Spanish peoples, and this, the third lecture in completion of the theme, so far as the so-called Latin group is concerned, was a history of the evolution of the Gothic style in France, and its gradual supersession in the 16th century under the influence of the revival of Classic feeling. Having sketched the development of the French nation, Sir Frederick showed that, after the dark days in which the memory of Roman splendour had grown dim, Charlemagne called architecture out of its sleep. For the restoration of Gallo-Roman splendour Charlemagne called around him artists and skilled workmen from the south and east. The Roman basilica was taken, the President continued, as the model of the new churches which, with his aid, the monastic communities began to raise through the land, and thus Roman architecture became the starting point of the new development of the art of building. Nevertheless, other foreign influences early became active through contact, direct or indirect, with other races. An illustration of the profound modifications which such contact could bring about may be found in a comparison, for example, between the sculptured façade of the Church of St. Gilles, in Provence, a region much under Roman and Greek influence, and the Church of St. Front, at Perigueux. The latter church was begun towards the end of the 10th century, a few years after St. Mark's, in Venice, and, practically, on the same plan; the former is of much later date, yet the southern example is still strongly impregnated with Classic tradition, whilst the Aquitanian Church, with its five domes, is wholly Byzantine in its general character. Here the inspiration is derived undoubtedly from the Venetians. Both these instances, illustrating as they do the receptivity of the Gallic intelligence, exhibit, also, conspicuously, the freedom with which it fashioned foreign elements to its uses. This freedom is almost startlingly displayed at St. Gilles, where Classic material is handled with an audacity which, if leading in some points to an almost barbaric incongruity, produces a result in the last degree impressive and stimulating. The work is thoroughly southern; but it is a work of true genius, and infinitely fascinating. At Perigueux, also, we find the fire of native genius forming and fashioning material not indigenous. In ground plan, St. Front is almost identical with St. Mark's, and in its general structural features has much analogy with the Venetian church; nevertheless, the impression produced—the form, for the colour is now, from floor to roof, that of stone newly and sacrilegiously flayed and scraped—is wholly different; that love for slender and soaring forms which was to mark French architecture in the future is already evident; forms which in the Venetian model are sturdy and squat are elongated here almost to slimness: the whole proportion, and, therefore, its whole character, is changed; the Venetian idea has been translated into French. The impulse towards a revival of architecture was, we saw, given by Charlemagne, but it was not till the 10th and 11th centuries that the movement reached its full force; and its development was due mainly to the great monastic community which, founded by St. Benedict early in the sixth century, had poured from Monte Cassino its influence over Western Europe. This famous order had become a mighty power in France, controlling from the central foundation at Cluny not less than 314 monasteries and churches over the face of the country, and had offered, in days when the land was given over to fire and sword, a sacred refuge to whatever of refinement, of knowledge, and of culture still struggled to live. The model first adopted in the greater part of France for the uses of the Christian Church was the basilica of the Romans, with its nave and its aisles, its narthex and its apse. In this model, however, certain modifications were needed to meet the requirements of Christian worship and ritual, or for safety, and out of them grew the type of church known as Romanesque. Of these modifications one, the substitution of wagge headed vaults for timber roofs—a change ma necessary by the frequent occurrence of fires led to momentous consequences, for it is in t problems of vaulting that the so-called Gotl style had birth. In the vaulted buildings of t Romans stability was obtained through in resistance: the solid weight of their vaults w taken up by vast masses of brickwork a concrete—you may, in fact, regard these edifi as virtually hewn out of a solid block. T substitution of the principle of a balance active forces to this principle of inert resistan is probably the greatest revolution ever intr duced in the science of building: we have h the generative principle of Gothic architectu its essence and its life. Let us note in passi that the presence of a pointed arch, except a structural form, does not constitute Gothic arcl tecture. Isolated radiating pointed arches ha been built in ages and countries in which t Gothic style was not dreamt of; a building mig be Gothic in structure and principle, witho showing a pointed opening anywhere; it through the roof, not through the window, th the formative Gothic idea entered. Let us t to follow rapidly some of the main steps by whi it reached its ultimate development. The fi substitute for the discarded timber roof was th waggon vault thrown first tentatively over th aisles, then over the nave; and here an eleme of weakness soon made itself felt—the walls the nave, carried on piers, and of no great thic ness, were not equal to the outward thrust of th vault, and gave way. Various expedients we resorted to; buttresses were added at the poin corresponding with the piers, a transverse ban or rib, was flung across the nave from pier pier, the vault from being circular was, in son cases, broken and made pointed, rendering th thrust more vertical, but leaving it continuou The problem was not yet solved, a counteracti force, in which we see the germ of the flyi buttress, had, in certain regions, been applied namely, a half-waggon vault above the side aisle taking up the pressure of the central vault; b this arrangement condemned to practical dar ness the upper part of the nave, which, inste of windows, showed a cavernous gallery. Aquitania, a succession of cupolas on pe dentives was early adopted—an arrangeme which, though, as in the case of the cathedr of Le Puy, it yields grand and impressive effect is in many respects unsatisfying. An importa step in the new direction was next taken Vézelay, where intersecting vaults, but witho ribs, were substituted for the continuous waggo head; the thrust of the vaulting being th directed to the supporting piles. This arrang ment was, however, still found unsatisfactor and on a narthex being added or rebuilt on large scale, the same disposition of vaults w retained; but they were made pointed instead round. A few years later, in the early middle the 12th century, a Benedictine monk, Suger, t great Abbot of St. Denis, began the erection a church in which tentative gropings gave pla to the systematic and logical application of a ne and fruitful conception—the idea of stabili based on the balance of active forces, express in a self-sustaining combination of upright su ports and vaulting-ribs, with detached buttress bringing their action to bear exactly on t points at which the thrust of the vaults gathered up. So late as the days at whi Viollet-le-Duc wrote his great Dictionary Architecture it was believed, and he endorsed t belief, that this far-reaching conception had aris suddenly and spontaneously in the brain of o man; more recent investigation, in which Monsie L. Gouse, in his sumptuous work on Gothic A has, so far, said the last word, has brought o knowledge more into harmony with the gene analogy of things. To the famous Abbot b longs, it is true, the honour of the first systema application of the true principle, and his gr work must ever remain a landmark in the histo of architecture; but it was, in fact, only the l and most complete of a series of experimer covering a period of nearly half a century—e periments of which the earliest is seen in t church of a Benedictine monastery at Morie val. The church is in the heart of the "Domai Royal," of which Paris was the centre, and it within this Frankish region that the vario other tentatives to which he had alluded are be traced; it is in this region also that it reach its fullest development and left its most perf achievements. The development of the co

unes, fostered not only by the Kings, but by ie Bishops, who viewed uneasily the strength id independence of the monastic bodies, gave, y laicising it, a new direction to the art of ilding. Cathedrals, not abbeys, were now uilt—wider and loftier structures, breathing an r of larger freedom, and expressing a fuller ublic life. From this day forward the trammels f antique tradition were wholly cast aside, and hile French architects constructed in a style orn on their own soil, they looked at home enceforth also for its decoration, in the lanes nd fields of their native country. Gothic rchitecture leapt to its height in an amazingly ort space of time. Between the great reign of hilippe Auguste and that of Louis the Saint early all the great cathedrals of France were egun or reached completion. While the general onditions of intellectual energy favoured the rowth of the new phase of art, the peculiar ptitudes of the race were singularly calculated o promote it. There is, for instance, a sense of he decorative in form in which the French have emained unrivalled. But a characteristic bent as played no small part in the development of heir architecture—namely, a strong leaning to ong ascending lines, to slimness of proportion, nd to perpendicular parallelism. You may see curious illustration of this propensity in a eemingly insignificant matter—the timbering of he rural architecture in the north and centre of rance. These cottages are mostly of modern ate, but they represent a tradition of which you nay trace the source in the oldest parts of those owns in which timbered structures of an early eriod are still preserved. If you look at the imbering of a cottage or house in a purely eutonic country—in Germany or German Switzerland—you will find that the spaces left etween uprights and horizontals are approximately square and crossed with rather frequent iagonal lines; in the French examples, on the ontrary, whilst the diagonal lines are very few, he perpendicular line is absolutely dominant; ne horizontal line generally sufficing for a whole wall or gable front, and the vertical timbers being brought so close that the space between them is often no wider than the timber itself. Now it seems to me that this race was peculiarly fitted to conceive and develop the new style of building—a style in which inertness is replaced by active force; a style which, while in its absolute plasticity it offered the widest scope for innovating genius, required, nevertheless, for its fullest development the logical clearness and grasp of ideas which were conspicuous in the mental equipment of that race; a style in which liberty and restraint, audacity and prudence, science and emotion were so marvellously blended. It was through the balance of these opposite qualities that Gothic building reached its highest level; it was in the disturbance of that balance, in the undue encroachment of mathematics on sound artistic feeling, that the seed of its decline was sown. From the moment that all the forces of which the poise and stability of a structure were the result were gathered up into a system of ribs, shafts, buttresses, and pinnacles, forming a complete self-sustaining skeleton carrying a roof, not of concrete, but having the play and life of masonry, it became evident that, structurally, the wall had become superfluous; it was a mere screen, and accordingly the Frankish architects proceeded with constantly-increasing boldness to its suppression, gradually restricting the solids almost wholly to constructive functions; manifest construction became thus a leading feature of the style. Apart from the primary statical motive, the broken arch became in vaulting almost a necessity; the sides of a square being shorter than its diameter, it is evident that a round arch struck diagonally across it must be higher than the arches spanning its sides, and if the field to be vaulted is a parallelogram or irregular in plan, the number of unequal levels at the key of the arches is further multiplied, and those levels can only be brought into even approximate harmony either by stilting the smaller ones—as was done at first—or by breaking the arches, and this latter course soon became universal. The pointed arch having thus asserted its place in the construction of a building, the desire to suppress all superfluous wall space, allied to a sense of fitness, prompted its adoption in the case of the windows, which presently reigned over the whole space between pier and pier; and this expansion of the field of light was further demanded for the display of stained glass, to which growing importance was constantly given as an element of effect in the internal decoration of churches, and with glorious results. No one who has not seen, as one still may see in France, a cathedral of which the glass is preserved throughout, or nearly so, can form an idea of the effulgent magnificence and poetic charm which attach to this flinging of a heaven of colour about the majesty of the house of prayer. In France this effect is often heightened by the glazing of the triforium, which is opened out by the substitution of a ridge-roof for a lean-to over the aisles. The peculiar æsthetic bent to which attention has been called, the love of slim and aspiring lines, had special scope in a style in which horizontal lines had no necessary place except to satisfy the eye with a sense of binding between the parts; and, in truth, the horizontal line rapidly dwindled, almost in some cases to effacement. So, for instance, in the Cathedral of Clermont-Ferrand, the only horizontal in the whole building, if we except the window-sills, is a very narrow string along the base of the triforium, and this does not go round the pier shafts, which spring, absolutely unbroken, from roof to roof. The supremacy of the vertical line is here further emphasised by the carrying of the shafts of the clerestory windows—as is not infrequent in France—down through the triforium, which thus becomes, in a manner, one with the upper lights. The total effect is extremely dignified, and gives that sense of satisfaction inseparable from the spectacle of a consistently developed dominant idea. Another element of dignity was added to the French churches by a wealth of sculpture. While the carver's art in France was during the Gothic age prolific beyond example, it early reached and throughout maintained a high standard of excellence. It was everywhere full of sincerity and freshness, often of great beauty and stateliness, and always in its application marked with a strong sense of fitness and artistic propriety. Sparingly used in the interior of the churches, it spread with unstinted, though well-marshalled, profusion over their external features. But even as the stability of a Gothic church rested on a nice poise of mutually counteracting forces, so the maintenance of the style itself at its perfect point depended on a due balance of the intellectual forces which had generated it. This balance was soon to be disturbed. The craving to bring down to an irreducible minimum the amount of material that would suffice to the stability of a building extravagantly lofty was irresistible. Mathematical calculation resulted in the rearing of such a structure as the Choir of Beauvais, which was so lacking in solidity that it gave way within a few years of its erection, was rendered relatively stable only by doubling the number of its supports, and is held together to this day only by a network of iron ties—a building which distresses by its stilted and meagre aspect. Another church which exemplifies the training down of constructive forms to the last extreme of attenuation is St. Urbain of Troyes, in which the flying buttresses have the skeleton meagreness of iron girders. Lines were soon needlessly multiplied; narrow ridges first ran up the faces of the shafts, and then, as if convexity of surface was in itself a culpable waste, what had been a shaft was hollowed into furrows divided by an arris; concavity and rigidity invaded everything with an exasperating angularity of effect. Of this you may see an illustration in the Cathedral of Auxerre, where the choir retains the fuller forms and those of the nave shrivel into concavity. But if the causes noted led, in structural forms, to a rigid multiplicity of vertical lines, exterior decoration, which rapidly grew in exuberance, gave scope to that love of sinuous serpentine forms, born of a sense of the grace of motion, which has always marked the French, and, whilst vertical constructive lines multiplied themselves in the interior of the churches, an incontinent exuberance of fantastic curves began to spread over their exterior surface, clothing them with an embroidery of wildest decorative fancies. In this development of what became in the end an uncontrolled orgy of the chisel, the first step was a breaking-up of the tracery of the windows and a substitution for geometric forms of a "flamboyant" arrangement of curves. Meanwhile, into whatever excesses the French carvers were betrayed at this period of Gothic art, the vivacity and spontaneity of their genius ever light up their work and disarm criticism. We feel throughout that, with whatever redundancy and mannerisms, they are expressing themselves sincerely and in their own vernacular. Gothic architecture, though it continued till late to produce fine work, had lost its perfect balance already before the close of the 13th century; it had forfeited also some of its rich personality; nevertheless it held its own with the vitality of an indigenous growth, and fought long and manfully with the new ideas in the days of the sudden swinging back to Italian influence. But before leaving this branch of our subject I will note an instance of the fine tact of the French church-builders—viz., their adoption, which I cannot regard as fortuitous, of the circular east-end, the "chevet." Mr. Fergusson, indeed, sees the source of the French ground-plan in the addition of a nave to an original circular building. This ingenious explanation does not offer an adequate solution. How beautiful a square east-end may be we in this country abundantly know; but a church so terminated is a more or less arbitrarily truncated arcade which might be produced indefinitely. In the circular arrangement, on the contrary, not only is the design more visibly closed, but every limb of the encircling bays strives back, and is gathered up into a key suspended immediately above and emphasising the holiest spot—the altar of the sacrifice. And now we turn to a wholly new phase in French art, the expression of a new order of ideas and of altered social conditions. During the 14th and 15th centuries the prestige of the fighting nobility had suffered much through the introduction of artillery and the reverses of the English wars. The middle classes, on the other hand, had, under the favour of the Kings, steadily risen in importance. It was not, however, till the second decade of the 16th century that, through the example of that brilliant dilettante, Francis I., the Italian contagion showed important results. Within the thirty-five years of his reign a host of palatial buildings were raised in a new style, which, if it had not, as had the style it pushed aside, the virtue of indigenous growth, was certainly marked by extreme charm and beauty. Meanwhile, borrowed though the new style was, the French at once moulded it to their own genius, and produced a result distinctly personal to themselves; and the modifications they introduced in the Italian style were just such as you would expect from the different temper of the race. The restrained and sweet gravity which delights us in the purest examples of trans-Alpine Renaissance is too often wanting in the French work of the same class, and if the rank of a work of art is according to the dignity of the emotion it stirs in the beholder, then the creations of the great Italians rise to a higher level than those of the artists of the French Renaissance. For vitality and variety, on the other hand, for exuberance of fancy, for resourceful ingenuity of construction, and for a delicate sense of rhythm and proportion, the superiority of the work of the French is conspicuous. Above all things, it is their own, and for this reason the jealous investigation of recent times in France as to how far Italian artists have been unduly credited with the building of certain of the masterpieces of the Renaissance in that country is, however valuable in the interests of truth, of no great moment to the dignity of French art. It is patent that all but every work of the French Early Renaissance, however it may have originated, bears the unmistakable stamp of the fusing energy of French genius. That the style was not born in France is a fact no one can challenge; that it was recast in that country into a distinctly French thing no narrowness can dispute. The keynote of the Renaissance movement being the assertion of the beauty of life and the dignity of man, its influence was naturally most felt in connection with secular life. The great era of church building was past, and, indeed, the existing places of worship were not insufficient. The main determining motive of artistic activity under Francis I. was the ambition of the king and his nobles to multiply places of delight for their residence, especially in the country. Prodigious and breathless was the activity with which châteaux were raised, first in the Royal province watered by the Loire, and then in and about Paris. In the first line of architects stood Jean Bullant and Philibert de l'Orme, and in the second, Colin Biart, Pierre Chambiges, Pierre Nepreu, *alias* Trinqueau, Gadier, Le Prestre, and Hector Sohier. Although the great outburst of activity in the new direction coincides

with the reign of Francis, Italian influence had already begun to assert itself in architecture as in other things in the preceding century. In these buildings, however, the French and Latin elements are jumbled into a pasticcio rather than fused into a whole. It is interesting to observe the attitude of a people possessing great building traditions and very definite æsthetic propensities, in the face of an innovation imposed on it, in a manner, from without, but stimulating to its sense of beauty and its appetite for the new. Two influences were adverse to the new fashion —first, the spirit of the men of the burgher class; and, secondly, the conservative attitude of the Church. We see, accordingly, on the one hand, the municipalities continuing for some time to build their public halls on the old lines, and, on the other, the clergy erecting Gothic churches well into the 16th century, and retaining the structural dispositions of ogival architecture even after the outer forms of the Renaissance had been accepted for sacred buildings. We see edifices constructed on the basis of a predominance of the vertical line piled up painfully with tier upon tier of parts taken from a style based upon the opposite principle. In the case of secular buildings, the transition from the Later Gothic was facilitated by the fact that square-headed openings prevailed already in that style, of which, too, the incontinence in ornament was acceptible to the exuberant spirit of the new art. The character of that ornament, however, was entirely changed; fantastic, foreign arabesque took the place of the floral decoration which had been one of the glories of the French school. Meanwhile the love for aspiring forms lived on, and the tendency to complexity died hard. The wealth of sky-line produced by spires and pinnacles was perpetuated in high-pitched roofs, turrets, and tall buttressed dormer windows. The sky-line of Chambord could have been conceived only by an architect having Gothic tradition in his blood. In other matters, too, we find the Gothic habit surviving. The external winding staircase, for instance, was long preserved, and the grouped shaft survived in a colonnette engaged on the face of a pilaster. But most interesting to observe is the tenacious struggle of the vertical line throughout French Renaissance architecture. The Orders, with their bold entablatures, did compel some stress on horizontal lines, though this restraint was in part evaded; but their effect was balanced by an emphasised vertical grouping and uniting of the openings in the different stories, and by projecting wings, towers, and pavilions, which marked with perpendicular lines of shadow the elevation of the French building. Of the first period of the style the finest examples is the south-west angle of the Court of the Louvre, by Pierre Lescot, a building made doubly stately by the fact that the reliefs which so richly clothe it are due to the hand of Jean Goujon, who, with Germain Pilon, marks the highest level of French plastic art in the 16th century. By this time the knowledge of Classic art was becoming more thorough, and the application of its features more correct, and with a more Romanising spirit, a tendency to larger forms grew up; so, at Ecouen first, and later at Chantilly, we find Jean Bullant introducing the *ordre colossal*, an order, that is, embracing the whole height of a façade. But even in adopting this purely Roman device, his Gallic blood prompts him to a flouting of the horizontal line. He does so with curious thoroughness in the Pavilion which bears his name at Chantilly. But Bullant was yet to be outdone, for in the design of the inner court of Charleval, a work begun under Charles IX., but never carried out, and known to us only through Du Cerceau, who speaks of it with extravagant praise, we see not only a similar omission of floor line, but, actually, niches with statues so introduced that they cut across the exact spot where the floor lies, so that an effort of reflection is required to assure us that the floor *can* exist there. Philibert de l'Orme, the learned engineer, architect, and writer, was an artist of well-balanced mind and scholarly training, whose conceptions are marked by dignity and refinement, but in whom the stamp of genius is not so evident as in the less-cultured Bullant. To De l'Orme is due the introduction of what is called the *ordre français*—a column of which the fluted drums are divided by ornamental bands. But the days were near when the light of creative genius in art was to burn low. With the close of the century we find life and spontaneity at a low ebb—little production, a tendency now to heavy monotony and now to barocque redundancy, and a lack of sense of fitness which admitted of masking with a ponderous Classic façade churches built on the scheme of ogival architecture. Officialism, too, in artistic matters was at hand, and soon Colbert was to regulate the arts by Royal decree, and to found an academy which admitted only one saving creed. To that period let us revert to notice the parallel development of painting and sculpture. In the latter art we have already recorded the names of Jean Goujon and Germain Pilon. These great artists were not without forerunners, of whom Michel Columbe was the most gifted, though his works lack both suppleness and definiteness of artistic purpose. Nicholas Bachelier and the Giusti, the latter a family of Italians settled in Tours, but true to their nationality in the character of their works, should also be named. These artists, even more than Michel Columbe, seem overrated. Turning now briefly to painting, we find in the 16th century but little to rejoice us. Yet a few considerable names relieve it from barrenness. When Francis the First began to build he did not find amongst his countrymen painters to whom he could intrust the decoration of his numerous palaces. The 16th century in France does not boast in painting, apart from the Clovets, any name of much calibre, except perhaps that of Perréal, and certainly that of Jean Cousin. By the side of oil painting and illumination the arts of enamelling flourished greatly in France. In this category the great School of Limoges is known to you; the names of Pénicaud, Léonard Limousin, Reymond, and Pierre Courtois are familiar to all. In the art of glass painting you have, first, the great anonymous "verriers" of the Gothic period, and then during the Renaissance such men as Cousin, Pinaigrier, Le Pot, and Engrand le Prince, of whom the first-named is the greatest. The French gift of colour as manifested during the Middle Ages and the Renaissance seems to be based less on a sense of harmony and subtle combination than on a keen sensitiveness to luminous splendour and intensity of hue. Further, in much of the earlier glass the sumptuous results obtained are largely due to scientific combinations, of which the outcome is not always equally happy. The effect almost exclusively aimed at at first was a purple effulgence of hue; and this was produced by a scientific juxtaposition of very small red and blue fragments of glass, corrected by a sparing interspersion of other colours, and controlled by the close network of the lead lines. Now, these reds and blues, which produce together the dominant tone, are not seldom in themselves crude and harsh in the extreme, though generally yielding in combination a most gorgeous hue; and it is suggestive that when departing from this scientific scheme of balanced gem-like spots of colour—a scheme which involved, of course, designs very small in scale—the glass painters from time to time introduced larger figures, they seem to have cut themselves adrift from a sure anchorage. Their instinct of harmony was not an infallible guide; certain it is that the colour is in these cases not seldom disastrously discordant. This uncertainty of instinct is seen even more clearly in the later works in which a larger scale was uniformly adopted. The enamels of Limoges, of which some are so admirable and some so harsh, suggest similar reflections. And here I must take leave of this great and teeming century, naming only the Huguenot martyr, Bernard de Palissy, the famous potter, and Helène de Hangest, to whom is now ascribed the famous ware of Oiron known as "faïence Henri II." How architecture fared in the following century, "the Grand Siècle," I have already, the President added, suggested. The same taint of inflated monotony which prevailed in the works of the builders spread also to painting. Dull already in the hands of Simon Vouet and Sebastien Bourdon, it reaches the height of turgid pomposity with Charles le Brun, whose magnificent energies seem in these punier days to border on the fabulous. The reign of Louis Quinze is not one of great architectural activity: it is best mirrored in the the minor arts that minister to the comforts of life. A sprightly daintiness presides over all artistic production. The sinuous curves which already in the days of the flamboyant style had pushed aside the severer and more noble lines of the perfect Gothic, and had in their turn been held in check by the Latin spirit in the earlier days of the Renaissance, broke bonds when the grave closed over the solemn monarch, and ran riot in the domain of the applied arts. A senseless writh of unmeaning curves held carnival from that d over every object of use or ornament, and identified have these forms become with a cert elegance of social *ton* that the most favou classes all the world over see in them to this d the last word of elegance and taste. Yet ev in those days of rapid mannerism there were m who escaped the general taint. In architect a noble severity commends the works of Souff and Servandoni, and in painting Chardin e ployed his delicate gift in the rendering of sim scenes of homely life. But the truest interpre of whatever was gracious and dainty in this ar ficial epoch was that greater painter, though truer artist, J. B. Watteau. Is there any less asked Sir Frederick in closing, that we may dr from this survey of artistic evolution among t French? I have dwelt with emphasis on t genius of their mediæval builders; do I advoc the adoption of Gothic forms for the purpose our own lives? I have spoken to little effect my answer can be doubtful. Artistic forms the vesture of ideas and the expression of ment conditions; but the modern mind cannot, wi fitness, put on the garb which was moulded the mind of a day long past. But if we may n fitly adopt those forms, we cannot too reverent note the spirit which presided over their develo ment, for a like spirit brought to bear on oth material and under other conditions may yet be new and noble fruit. And the characteristics that spirit are: a masculine independence, tenacious grasp of central principles, a fearl sincerity in expression, a scorn of shams, a trust on truth.

THE ARCHITECTURAL ASSOCIATION

AN ordinary meeting of the Association w held on Friday evening, the Presiden Mr. F. T. Baggallay, in the chair.

SUGGESTIONS FOR THE PRACTICAL EDUCATION AN ARCHITECT.

A paper on this subject, which we reprodu in full on page 861, was read by Mr. T. Jackson, M.A., F.S.A.

Mr. H. O. Cresswell, in proposing a vote thanks to the lecturer, observed that in givin the Association the benefit of his experience an advice, and in discussing the scheme in so cal and quiet a manner, Mr. Jackson had done the an inestimable service, although they might n be able to agree with all his conclusions. It w to be regretted that Mr. Jackson's counsel ha not been obtained when the curriculum was bein framed. The Committee had not entered upo the Educational Scheme lightly, but neither di they regard it as perfect. They were very gla to hear Mr. Jackson's suggestions for improvin their system at the studio. The hint tha students should make details to large scale was valuable one, and so was the suggestion that th students should learn to put their designs int perspective—one which, although perhaps diffi cult to deal with in their practice, he cordiall endorsed, for many of the drawings submitte showed a lamentable ignorance of the element of perspective. The suggestion as to visits t workshops was also a valuable one, and h should be glad to find that arrangements coul be made for visits by these students to series of workshops. He did not propose to g into the question of examinations, as the member of the Association could hardly discuss th methods of the Institute. The Association' new scheme had been founded on the principl of accepting things as they actually were. Ex aminations in architecture existed, and if th Association did not prepare students for it, the would certainly go elsewhere. Of late years while the attendances at their classes had bee decreasing, a larger number of candidates ha presented themselves annually for examination showing that they must have been trained b crammers.

Mr. F. R. Farrow seconded the vote o thanks. Having had considerable experience a a crammer, he quite endorsed all that Mr. Jack son had said as to the evils of the system Students always wished to acquire just as littl knowledge as would enable them to pass. O some other points he could not so heartily concu with the lecturer. He could not agree in hi statements as to the value of the study of th history of architecture, and particularly with hi assertion that it would not do a man any good a an architect. The study tended to fit a man fo

ractice as an architect, and while the committal o memory of names, dates, and places might not e of practical benefit, yet the stores of knowdge were drawn upon by a sub-conscious ental process when a man set himself to esign. He did not refer to mere copying; ut the designer was able to draw from ne stores of past study, and to put together omething entirely different from the source hence it was derived. In the works of Mr. ackson, for example, they could often see hence he obtained his inspiration; but it was o imbued with Mr. Jackson's own spirit, and so arked by the peculiarities of his style, as to be is own. History really embraced the study of ne way in which men of the past dealt with the roblems before them. The work of Viollet-leuc on "Construction" was one of the best xamples of the history of architecture properly orked out in the whole domain of the ubject. He could not agree either with Ir. Jackson as to the relative value o the modern architect of Greek and Roman uildings. We could not properly understand ne Roman detail without first studying that of ne Greeks, for the Roman was but a developont of Greek work through the Græco-Roman ork of Asia Minor. As the late William urges had told them in that room, from the reek work they could learn principles. Burges's rt was itself widely removed in style from reek, but he held that it was necessary to study reek art.

Mr. Reginald T. Blomfield said those who gned the memorial would not come over and in the Institute and Association, because they issented from their principles. The establishent of an examination in architecture cut at the ery root of architecture, and it could not be enied that the Association's new scheme of ducation was designed to lead up to the examina-ion. Still, there need be no ill will in the natter. The fact was that there were two iffering conceptions of what an architect was. 'he view of the Institute was that he was a erson of three parts—a scientist, a man of busiess, and an artist, all these terms having, they eld, an equivalent value. The other view, that aken by those who signed the well-known nemorial against examinations, was that it vas absolutely impossible to separate contruction from art, as Mr. Jackson had o admirably put it that evening. Then he memorialists held that surveying had othing to do with architecture, and that, therefore, quantity surveying, estate planning, and ll the work of a commission agent, should be xcluded from an architect's career. If that were ccepted, a good deal of the new scheme of eduation would be unnecessary. They would send young man to a builder's workshops to learn is trades: he considered that he must have some ffice preparation before this was attempted, nd he should certainly be taught how to write a ood specification. Under the present system of rchitectural pupilage, it depended on the head f the office whether a young man were well rained or not. He thought any advance n architectural education should take place n the lines of the Royal Academy schools, proerly developed, with the addition of practice in workshop for artists of all classes. Professionalism, which was a genteel name for commercialism, would then disappear in a few years, nd then they might carry into effect the admirable motto of the association: "Design with eauty, build with truth."

Mr. Sydney Vacher hoped the Association would not decide to send its students down to builders' workshops in shoals, for if they did, the young men would assuredly be regarded as infernal nuisances. The better course would be that individual principals should bargain with builders to allow their pupils to spend, say, a day a week in the workshop, and should also arrange with clerks of works that the pupils should assist them in setting out the work and similar jobs. He thought principals ought to have the moral courage to tell pupils, if necesary—and there were many to whom it would apply—that they were not fit to become architects, but ought to devote their attention to something else. Many men, too, who entered the profession by the back door as office boys and tracing clerks, would make excellent craftsmen, and then office training would fit them the better to carry out the ideas of other men. His experience had been that the knowledge he gained from clerks of works and builders' foremen was of no use to him in passing the voluntary examination of the Institute, and he believed this would apply to the examinations now in force. The standard of the constructional section of those examinations was always put very high, and the artistic section very low. In reality, the architect did not begin to learn his proper work until he went into business. He should like to ask the practical question whether for a certain fee a young man could go to Mr. Jackson, for example, and get a few honest criticisms on his work? There would, if this course were generally adopted, be less of the awful work which a young man had to put up in his early days, and which his client had also to put up with.

Professor Kerr was glad to have heard from Messrs. Jackson and Blomfield some of the views held by their party. He had never made any pretensions to be a great artist, and, generally speaking, he should advise young men not to strive too earnestly after that position. What the public wanted—and he assumed that they were all servants of the public—was to have a certain amount of grace conferred on a building, this building being previously thoroughly well designed. Of course, when they met with a genius it was only right to give his abilities full play; but, generally speaking, the average man—and he assumed that he was addressing a meeting of average men with a few brilliant exceptions — would find that wisdom lay in moderation, even in artistic inspiration. As an impartial man he wished to say that he thought there was considerable misconception on the part of Messrs. Jackson and Blomfield as to the views held in the Institute. There was no disposition on the part of its members to disparage art knowledge, and if they would join the Institute he would promise them they should be given as much rope as they could wish for in regard to the art and enthusiasm they could introduce. The professional examinations had been established by Mr. Cates, who was a perfect man of business, and, indeed, a representative of the three qualities in an architect, the enumeration of which had so much offended Mr. Jackson and his friends. He must remind them that the architect had to serve the British public;—(No, no, and Hear, hear)—well, he would address those who were serving the public. He did not mean to disparage art, for he had advocated it foolishly all his life. The public opinion of the cultured classes in this country stood this way. They demanded first that a building should be thoroughly well planned; secondly, that its body corporate should be properly tested; and thirdly, they would, in moderation, take as much real and substantial grace as the architect could put on to the work. If any architect thought he could put too much grace into a building, he would leave him to settle the question with his employer. It was this added grace which created the great gulf between the mere builder and the architect. Now the Institute was beginning to say that other professions placed a bar across their gates to keep off outsiders, and thought it was desirable to place a similar bar across the gate of entrance to their own profession, and who could deny that this was desirable? He was not going to say that the argument might not be carried too far—indeed, he would grant that it seemed likely to be carried too far; but he would ask Mr. Jackson and his friends not to disparage the endeavour of their colleagues. They were seeking to make a respectable appearance before the British public, such as was being done by everybody else. He could not, however, forget that, in his younger days, the Institute of Architects was a learned society, on a level with the Royal, the Antiquaries, and other bodies of the kind; but if Fellows were to be admitted as a result of having passed certain examinations it would no longer stand on the level. It was all very well to examine a young man for the Associateship, and, if he failed, to relegate him to his studies; but men who had been in practice, say, ten years would not stand such an indignity. He desired to express his great satisfaction with the doctrines promulgated by Mr. Jackson with reference to education. Nothing could be more sound and practical in its tone, and such a dissertation could not fail to do good. In all that he had said on that subject he represented the Institute of Architects to the letter. He hoped that young men would not expect too much at first from the Association Scheme. He was still of the opinion he had before expressed, that they could not take too serious a view of the profession. The Association was to be congratulated on the boldness, earnestness, and intelligence with which they had entered on the new departure.

Mr. E. S. Prior must disagree with everything that Prof. Kerr had said. If architecture was what the last speaker had suggested, his advice to almost everyone would be to leave it alone. If the public considered an architect to be a degraded impostor, they ought to endeavour to lead them to expect a higher standard. Sir Gilbert Scott, in his presidential address to the Institute, declared that the present state of architecture was a national disgrace. Professor Kerr had repeated the suggestion that evening that the Institute would like to have the memorialists back within its ranks, and suggested that it would turn over a new leaf, and be indeed an Institute of Architecture. But when they came to put these kind intentions to the test, and brought before the Institute the fact that they distrusted the system of examination, the memorialists were told that the system could not be changed, for it had been established by Royal charter. This reply threw some light on the value of the good intentions of the Institute. But the subject of the evening was education. This could be viewed in two ways—as an end in itself, and as a means—the latter being the view held by the Institute, the end being the preparation for examination. He held that an Association for young architects should have nothing to do with the latter form of education, but should confine itself to education for the simple purpose of making a man a better architect, whether he were a servant of the public or not. The speaker referred to his personal experience as a pupil, that even under a good employer a pupil learned most concerning construction when sent out on actual works, and remarked that Viollet-le-Duc's dictum was true, that the study of archæology would not make a man an architect, but that the study of construction would in time do so. The real artist was, in fact, the man who worked, and not the man who sat in his office and made drawings. An architect's work could not be learned from books, but by seeing work done and by mixing with workmen. He could not understand an architect as the three-legged animal described in a recent presidential address. The architect was not a commercial man, and certainly not merely a professional man seeking a living and an income. The true aim of education by the Association would be to prepare a man to be a reality, and not a sham or half-architect.

Mr. E. Prioleau Warren objected very strongly to some of Professor Kerr's views. No doubt if a young man wished first of all to make a respectable appearance before the world, an examination afforded him the best facilities for so doing; but Heaven forbid that a young man should set out with that aim. Although it was in one sense true, as Professor Kerr said, that they were all servants of the public, he should protest against the assumption that architects were consequently to pander to the taste of the public. It was pleasant to hear that the Association was taking an independent stand, and was merely aiming at becoming a cramming school for the Institute examinations. He held that the architect, however unworthy his work might be, was precisely as much entitled to consider himself an artist as was an unworthy painter or sculptor. The question whether architecture was an art or a profession was not merely a question of names, but was one of facts and principles.

Mr. H. H. Statham said there was just this difference between architecture and sculpture or painting. People lived in houses, but could not live in pictures and statues, and it was all important that those who designed houses should be able to protect the inmates from bad drainage and other faults. The Institute had established examinations in response to a direct demand from the public.

The President, in summing up the discussion, observed that now they had heard the views of representative memorialists like Messrs. Jackson and Blomfield, there did not appear to be such a wide difference in their views as had been supposed. The Association had found it necessary, now that examinations in architecture had been established, to make provision for education for such tests, and had therefore included in their curriculum certain subjects, such as land surveying, which were not strictly architecture. They had excluded workshop practice, as no suggestion yet made had appeared

practicable. The memorialists were mistaken in their view, however, that the new scheme was intended solely as a preparation for the Institute examination.

Mr. Jackson, in acknowledging the vote of thanks, which had been carried by acclamation, said he was pleased to find that nearly all of those who had spoken were on his side. Nothing Professor Kerr had said had tended to remove his objections to the course the Institute had adopted. If architects were servants of the public, as Professor Kerr had said, the view he had propounded still held good that grace could be "added" to a building, for construction and design must go on simultaneously. There was no point at which architecture came in as an addition to construction, both must co-exist from the first. If architects required educating, the general public needed it still more. It was not for architects to serve the public, but it was their business to teach the public, and to put before them good work, and the more this was done by architects the higher would be the standard held outside. It was no use preaching by books—the public would not even go to the architectural room at the Academy, and if they did, he feared they wou'd not learn much. Prof. Kerr had asked why the memorialists did not join the Institute. It might be very disrespectful of him, but he could never understand why there should be an Institute of Architects at all; to take the extreme view, he could not perceive why there should be a registered and close body of architects any more than with other artists, for nothing could be more injurious to art. He could understand an Institute of "Architecture," but not of "Architects." He did not like to see the distinction drawn between architects and builders. Nine-tenths of our buildings were erected without being designed by architects, and what did the Institute, composed of men who designed one-tenth of the buildings, propose to do for those who carried out the other nine-tenths? Did they propose to leave the other buildings to take their chance? Let them take the membership of the Institute, again. They had a right to expect such a body to be composed solely of architects; now, was it a fact that members confined themselves to purely architect's work? If they took a proper view of art, its pursuit must absorb the whole of a man's time. He had been told that in the "London Directory" certain members of the Institute—about half, he believed—had a star to their names, denoting that they were also surveyors. Was that a body which they could ask the memorialists to join? If the Institute professed to be a close body they could not be too particular whom they admitted. He had been told that a mere surveyor could not be admitted as a Fellow; and what could the Institute do if a Fellow afterwards engaged in surveyors' practice?

Professor Kerr and Mr. Vacher having risen to correct Mr. Jackson, the President suggested that that was hardly the time or place to discuss the condition of membership to another body, and Mr. Jackson closed his reply by explaining that he did not discourage the study of old work. He simply held that work, whether old or modern, should only be studied if it were good of its kind, and, as a matter of fact, there was a larger proportion of good in old than in modern work.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute was held on Monday evening, the President, Mr. J. MacVicar Anderson, in the chair. It was announced by the President that, by resolution of the council under the provisions of By-law 23, one Fellow and three Associates had under By-law 20 ceased to be members of the Institute, viz.:—Arthur Young, 1A, Inverness-terrace, W.; Charles Low Cadney, 40, Chancery-lane, W.C.; John Mossop, Commercial Buildings, Kidderminster; and Charles Edward Powell, 89, Chancery-lane, W.C.

THE EXAMINATIONS IN ARCHITECTURE.

The President announced the results of the examinations recently held at Manchester, and in that room at Conduit-street, W. For the Preliminary Examination, 69 candidates presented themselves out of 74 who had entered. Of these 21 were exempted from the tests, and of the others, 34 were examined in London and 14 in Manchester. Thirty-nine passed, making, with the 21 exempted, a total of 60 who had been entered as probationers, and the other 9 were relegated to their studies. For the Intermediate Examination, 16 out of 19 presented themselves in London, and 11 in Manchester. Of these 23 had passed, and were enrolled as students, and the other four had been relegated to their studies. For the examination in architecture, qualifying for the Associateship, 40 presented themselves out of 48 candidates. Of these 26 had passed, and the other 14 were relegated to their studies. The board of examiners considered that the first place in the last examination was taken by Mr. John Begg, formerly of Glasgow, now of London, to whom they had awarded the Ashpitel prize, and highly recommended Mr. Owen Fleming, of London, and Mr. John William Twist, of South Shields. The President remarked that after the close of 1893 all who underwent the qualifying examination for Associateship would have to pass the preliminary, intermediate, and final examinations. He also suggested that allied provincial societies could aid the examination movement by establishing in each large town a studio, such as had been already formed in Sheffield by the local Society of Architects and Surveyors. The fact that some candidates in each class had been relegated to their studies reflected no disgrace to those gentlemen, but at the same time it demonstrated that, contrary to the statements of some persons outside the Institute, these examinations were genuine tests. The examinations were progressing quite as satisfactorily as could have been expected. In conclusion, the President proposed a hearty vote of thanks to Mr. Arthur Cates, the indefatigable chairman of the Board of Examiners, and to his fellow members, for their arduous and unpaid labours, and a second vote of thanks to the Manchester Society of Architects for conducting examinations in that city.

These motions were seconded by Mr. Charles Barry, and carried amid applause.

AMERICAN THEATRES.

Mr. Horace Townsend, late of New York, read a paper on this subject, illustrated by numerous plans and sections. He remarked that, having been, during twelve years' residence in the United States, four years a practising architect and the remainder a dramatic critic and writer, he had had exceptional advantages for studying the American theatre. The theatre was, as now understood, a comparatively modern institution, and less hampered by precedent or tradition than most public buildings; but certain influences caused all theatres to present a family likeness, though the features offered points of difference. It was a curious fact that the American theatre-type followed the French in having no pit, although the theatre in America had, from a historic point of view as well as an architectural one, generally followed England rather than France. It was not until the middle of the last century that a permanent theatre was established even in New York, and, as far as could be judged, it was not unlike one of the smaller London playhouses of the same epoch. A generation or so ago, however, the Americans had become a theatre-going people, and theatres of pretensions, such as the Old Bowry, the Academy of Music, and Wallack's were built, following the English model with one important exception—the pit. It was, he thought, the inherent democracy of the people which led to the planning of the theatre with its "pit" (a term unknown in America) on the ground-floor level, and to the abolition of all boxes save the four on each side of the proscenium. In every case the theatre, even at that date, was conceived on a simple and sensible plan — viz., an oblong block divided in three parts transversely, of which the largest was in the middle, occupied by the auditorium; the second in size at one end, devoted to the stage; while the third was again divided into three parts by lines parallel to the greatest length of the oblong, the central of the spaces being devoted to the main entrance, which thus led directly from the street to the auditorium, and in the space on either side were the means for ascending to the higher portions of the house. The very latest American theatres were planned more or less on the same broad lines; but for some score or so of years the theatres erected afforded very few points of difference, many being built from one set of plans. During the 'seventies, however, a great influx of theatre-building took place, but it was not until the close of that decade that a small theatre erected in New York introduced a new era of American theatre architecture. The Madison-square Theatre, presenting many original points, was the outcome of the talents of more than one man. Two brothers named Mallory (one a Doctor of Divinity, the other the editor of a religious newspaper) provided the funds; an actor and manager, one Steele Mackaye, a portion of the ideas; and two clever young architects, Francis H. Kimball and Thomas Wisedell (an Englishman), the professional skill which put the theories into practice and materially improved upon them. Though the old form of horseshoe balcony or gallery, with the floor sloping upwards on one plane, offered excellent opportunities of hearing, people seated at the sides had a limited view. These architects obviated this difficulty, and gained a fairly large seating accommodation in an auditorium of limited capacity by sloping the main floor uniformly upwards from the stage, which was raised but slightly above the level of the auditorium, and each row of seats on the main floor was raised about 4½in. above the one immediately in front. The balcony above this main floor was very deep, approaching in its centre much closer to the proscenium line than usual, but instead of the horseshoe curve, the front was twice broken abruptly in its outline, being in the centre a little flatter than semi-circular, with the sides of an ogee form. Other details of the Madison-square Theatre were then given by Mr. Townsend, notably the arrangement of a double stage, the ventilation and warming of the auditorium, the picture-framed proscenium, and the overhead orchestra. Although the theatre was very successful, the practical good sense characteristic of the American people prevented a slavish imitation of it. Certain points, including the double stage and the overhead orchestra, not being found wholly successful, were discarded; but the heating and cooling apparatus and the seat arrangements were in the main followed by subsequent designers, and in existing theatres. The author then proceeded to point out the salient points of difference between the ordinary theatre in New York and London, taking, as an example of the former, the Madison-square Garden Theatre (not the building above referred to), and of the latter Terry's Theatre, designed by Mr. Walter Emden, as a favourable specimen of a London house. The Madison-square Garden Theatre was chosen by him as one of the first built under the new building laws, Terry's Theatre being also selected as of recent date. A noticeable difference was the greater space devoted to the stage and auditorium in the American theatre, though land was as a rule dearer in New York than London, and rentals higher, while the population was less than half of that in London. Then the great simplicity of arrangement — the main floor devoted to seats of one character and entered almost directly from the street; the balcony seated in the same homogeneous way, and reached by a broad and direct staircase—and the readier accessibility of the dressing-rooms, some of which open practically on to the stage, and none of them being below the level of the street; a point to be by no means overlooked. As regards the warming and ventilation, the author was almost inclined to sum up the difference between the two countries by saying the Americans heated and ventilated their theatres as well as cooled them in the summer, while the English did not; but he thought that might be beyond fair criticism. Certain it was, that in all the later theatres in America ventilation was as nearly perfect as might be. Mr. Townsend dealt next with several other theatres in New York, giving a description of each, among them the following:—The New York Casino, by Messrs. Kimball and Wisedell, one of the most beautiful theatres he knew of; Palmer's Theatre, not unlike the London Lyceum in form; the Metropolitan Opera House, the largest in the city; the Broadway Theatre, the Lyceum, the new Fifth Avenue, Hammerstein's Opera House, and Harrigan's Theatre. Though he had intended to be silent on the subject of decoration, he could not refrain from adding that London had no theatres that could be compared with the Metropolitan Opera House, the Lyceum, the Madison Square, or the Madison Square Garden in that respect; each was distinctly individual and original, and distinctly pleasing in effect. Of other theatrical centres in America, Philadelphia possessed few theatres calling for remark. Chicago, now that McVicker's was burned down,

was principally known by the Auditorium, which was a truly American building, called a theatre, and on occasions serving the purpose of one; in point of fact it was an enormous hall, designed chiefly for great musical festivals and political conventions. It was seated for 5,000, but could be reduced in size. The stage was most marvellous. It was worked by hydraulic pressure, and was divided into sections a few square feet in area, each of which could be raised or lowered independently of its neighbours by touching a button. No borders were used, but sky effects produced by a species of domed panorama. In Boston the author referred to the Boston Museum, the Boston Theatre, the "Tremont," and the Grand Opera House, which was illustrated by working drawings lent by Mr. N. B. Goodnow, the owner, and described in detail. Mr. Townsend held it was characteristic of the American client to consider that the best was the cheapest in the long run, and to this was greatly due the growth of a healthy and advanced architectural school in the United States; and perhaps also it was on this account that the New York Building Law, which was founded on that of Vienna, had been adopted without question or murmuring.

A discussion followed, and the usual vote of thanks was accorded Mr. Townsend.

SUGGESTIONS FOR THE PRACTICAL EDUCATION OF AN ARCHITECT.*

THE subject of the training of architects to the pursuit of architecture is one about which more has been said and written of late years than at any time before. It is a subject, too, about which there is, perhaps, more difference of opinion among us than about any other connected with our craft. That some better system of training young architects in the way they should go is desirable seems admitted on all sides. For although the advantages of pupilage or apprenticeship are so great that they are not likely to be given up, still the student must of necessity supplement the experience gained in his master's office by study and reading of his own; and the office is and should be to him rather the place where he may expect to see put into practice the lessons he has learned elsewhere than the place where he can expect to be taught directly everything that he ought to know. He has, therefore, to join classes at art schools, and to enter on a course of reading, sketching, and independent study of his own; and it is here that his troubles begin, and here, too, that he is likely to be perplexed by the totally different courses that are proposed to him. The first nostrum that is offered him is one that is at first sight quite beside the mark—examination. To his demand for instruction, the Royal Institute of British Architects replies, "We don't profess to teach you; you must get taught as best you can, but if you will come to us afterwards we will examine you." Now, the question of examination is not exactly our subject to-night, but it touches it in so many points that it cannot be avoided. For the present, however, we will pass it over, and by-and-by I shall find it necessary to say something more about it. After we have defined, with what preciseness we may, the kind of training and instruction necessary to make a man a tolerable architect, we shall be better able to judge how far the test of examination is applicable to it. A better answer to the demand is that which you yourselves of the Architectural Association have given. The voluntary or mutual system of instruction which you have for so many years usefully carried on is now being expanded under your new scheme into a wider and more complete plan of architectural education, which, if it is properly carried out, ought to go far towards supplying the want of which students complain. You are just at the beginning of a new career; it rests with you either to make it barren or fruitful; the question of its future usefulness depends entirely on the direction you give it at first starting—whether you shape it on the old lines of textbooks and stale examples and conform it to the cut-and-dried rules of a hard-and-fast curriculum, or whether you guide it with a lighter and more liberal hand, and, recognising that all men are not gifted in the same way, give to your system that elasticity which will enable each student to develop any special gifts he may possess. The success of your scheme will, in fact, depend entirely on the view you take of the student's needs and of the nature of the instruction that will do him the most good. What, then, is it that the student wants to be taught in order to become an architect? In the first place it is clear he must learn how to build well. Construction, planning, choice of material, and the proper use of it according to its nature, are not architecture, but they are the foundation of it; and, more than that, it is they that have moulded all the architectural styles that have ever really lived into the form by which we know them. But skill in construction and knowledge of building materials will not suffice to make the architect. He must not only be a good constructor, but he must know how to construct artistically as well as solidly. What architecture does for building is to give it the means of expressing itself, and of expressing itself with beauty and propriety. It does for building what the actor does for the play. The play may be written as well as you please, the repartee may be brilliant, and the dialogue sparkling; but if you drawl it out in an inexpressive monotone you will at the utmost convey the bare meaning of the words, and you will awake no emotion. But let the actor declaim the same words with passion and feeling, and he will make you ready to start from your seat, or draw tears to your eyes. Just so with our art; two designs may be equally good in point of plan, convenience, and construction, but the inartistic design, which stops with mere building, will give no pleasure and rouse no emotion; while the other, in the hands of an architect worthy of the name, arrests your attention and delights and satisfies the sense. But though good building must precede good architecture, do not think that architecture is a sort of ornamental varnish that may be laid on to something else that is brought to it ready made. It cannot be applied to a building by way of improvement, in the same way as you put gilding on to a picture-frame, or butter on to bread. Your art and your construction must go together, hand-in-hand, from the very beginning. From the very first you must work with a view not only to strength and convenience, but also to beauty and fitness; from the first your plan and your architectural design must grow up side by side. While you contrive approaches and arrange your rooms, your mind will be busy at the same time forming a picture of the building as it will work out on these lines, and as you go on you will shift a room, or a wall, or a pillar, recess one part, project another, or drill the whole into symmetry according to the architectonic idea in your mind, and to the character you wish the building to have. All this will advance *pari passu*; there is no especial moment at which one can say, "Here architecture comes in." It has been there from the beginning, inseparable from the plan and construction, affecting and modifying them in a hundred ways, and being affected and modified by them in its turn. For their influence is reciprocal. If it is bad to study construction independently of architectural considerations, it is, perhaps, worse to study architectural design apart from construction. It cannot stand alone. Construction is the framework or skeleton on which the figure is modelled, and if you deprive it of its backbone, architecture falls into a helpless mass of powerlessness, as incapable as a jelly-fish. This, then, is what the student of our craft has to learn in the first place, and as the key to all that follows—to construct well with an artistic motive. Mere constructive skill will make him an engineer, but will never make him an architect; and mere acquaintance with architectural forms and skill in reproducing them may make him a good draughtsman, but will never make him an architect. Construction and design must be learned together, not as separate studies, but as one simple subject to be mastered by everyone who aspires to be an architect. Now, while there is abundant opportunity for learning building construction pure and simple, irrespective of æsthetic considerations, there is no school, so far as I know, for teaching construction in the architectural sense which I have indicated, and here is a want that your new studio may admirably well supply if you manage it aright. By way of making quite clear what I mean, let me make some remarks on what I saw there a few weeks ago when at your invitation I attended as Visitor of the Advanced Class of Design. Among the designs that were then produced were several that showed considerable promise. Mistakes in planning, of course, were to be found, but they were generally of a kind that experience would easily correct. What struck me as especially amiss was that the authors of these designs had seldom or never really considered how their designs were to be carried out. There were open-timber roofs that looked pretty enough on paper; but which I was obliged to point out could not be constructed, because timber was not to be had 3ft. wide. There were arches, graceful and stately, which, for want of proper abutment, would infallibly have brought the building to the ground. But the worst was that the designers showed so little appreciation of the scale to which they were working. The drawings were all to the scale of 8ft. to an inch, and few of the students had thought what would be the effect of their details when enlarged to the real size. Some of them, when asked to sketch to a larger scale a section of the jamb of their windows or doors, were unable to do it. They had never thought about it, any more than they had about the scantling of their timbers, or the abutment of their arches. Now these are examples of design being studied apart from construction, and I should like to repeat here the suggestion I made there—that every student as he goes on with his design should make detailed drawings to a larger scale, or sometimes full size, of each piece of construction, or each architectural feature. He could not fail then to know his own meaning. He would not be misled by his own small-scale drawings, than which nothing is more deceptive even to an experienced eye, much more that of a student. This year, among the designs sent up for the National Art Prizes at South Kensington, was one which showed considerable ability, and was drawn in a taking way. A scroll of simple foliage, delicately touched in, filled a space over a doorway, and in the drawing looked very well; but measurement pitilessly exposed the fact that the leaves were 4ft. across, of which the author was probably quite unaware. He had been deceived by the scale of his own drawing, and had he been going to erect the building he would have had to alter his design; for, with his absurd leaf, the panel which it fitted would have had to go, and the whole composition would have been affected. There were submitted for competition numerous other designs where construction had been altogether ignored or evaded; domes and lanterns with no visible means of support, and so on; but I have selected this simple instance because the author had evidently, to a certain extent, considered his design properly and thought it out, and would not have made this mistake had he taken the trouble to make a working sketch, however slight, to a larger scale. Another suggestion I ventured to make in your studio the other night was that besides being always required to draw details of the design to a large scale, the students should proceed to write a short specification of the work. What is a specification? I do not mean the senseless farrago of repetitions and stock-phrases that some people write, but a sensibly-written document, with no unnecessary verbiage. It is simply a letter to the workmen, telling them once for all what, if you had no specification, you would have to tell them bit by bit as the work went on. You forestall the innumerable questions the workmen would have to ask when the occasion arose by writing their instructions down for them before they begin. But it serves another purpose as regards yourself. It forces you to define to yourself your own intentions. It perhaps reveals to you something in your design that will not do, and compels you to alter it; it obliges you to fix the notions that were floating in your mind, so as to admit of being put down in black and white; and it discovers to you any point on which your knowledge is imperfect, and about which your ignorance may need to be enlightened. I venture to suggest this as an excellent corrective to the tendency to fanciful and unpractical design, of which I saw signs in your new studio, and which cannot too soon be reduced to the stern rule of commonsense and necessity. Let this, then, be the first rule of your studio, that every student should make it clear to his own mind, and to that of his teacher, how his design is to be carried out—how the thing he is designing is to be made; and, if he cannot explain this satisfactorily to himself and others, he should be told that it is of no use his going on till he has cleared up the

* By T. G. Jackson, M.A., F.S.A. A paper read before the Architectural Association, Dec. 11, 1891. (See p. *post.*)

mystery and solved the problem in a satisfactory way as regards both sound construction and good artistic form. The great importance of this becomes evident when you consider what it is that an architect is called upon to do when he has a building to erect. Unlike the painter and sculptor, he does not produce his result by handling and shaping the materials himself, but by directing others how to do it. Remember that it is your work to design for craftsmen. What you draw on paper they will have to make somehow as best they can, and if you do not know how your own designs are to be carried out, how are they to know it? As you are working out your plans and elevations, try and put yourself in the place of the clerk of the works or foreman who will have to work from them; ask yourself what explanations he would need, and amplify your details and descriptions to meet his imaginary wants. In this way you will avoid making mistakes and omissions which might upset your design, and which otherwise you might not be able to detect; and you will discover to yourself your own ignorance and see what it is you have still to learn. And while I am on the subject of your drawing-classes, there is another suggestion that occurs to me, and that is, that the students should as early as possible be accustomed to put their designs into perspective. Nothing is more misleading than the habit of designing in elevation. An elevation is nothing but an upright plan, just as a plan is, if I may so put it, a horizontal elevation. Both are mere conventional representations, mere working diagrams, correct for use with rule and compass, but conveying no idea of the effect of the design. You may take it for a general rule that a building which looks well in elevation rarely looks well in perspective, and as we see buildings in perspective, and never in elevation, you will readily see which of the two ought to be first studied. My own practice, except in the simplest buildings where I can trust my experience without trial, is always to start a perspective at the same time as the elevations, and when the building is got to look right in perspective, I work back from it to the elevations, and alter them to suit the perspective. And this I would strongly recommend to your students as the best way of shaking their confidence in geometrical drawing, and teaching them as they go on to consider how the proportions and dimensions they are adopting will strike the eye in actual work. Some of the best among the designs which were shown me the other night would have come out in perspective very differently to the intentions of their authors, and, I fear, have caused them considerable disappointment. It is a common joke against architects that they take in unwary clients by showy, attractive drawings, that hold out a promise which the building fails to realise; but I am quite sure that architects themselves are quite as often taken in by their own pretty drawings, which come out very differently in bricks and mortar from what they appeared on paper. So much, then, as to drawing, which, after all, is not the main thing: for our drawings, it should be borne in mind, are not to be regarded as works of art, but rather as diagrams to explain the design to those who have to realise it. The design is the great thing, and the main object of an architect's education should be to train him in habits of design, to strengthen his imaginative powers by exercise, and to correct his taste by showing him good models. Two things are necessary to him—imaginative powers and knowledge. No one can give him the former, and if he is quite devoid of it, it is useless of his thinking of being an architect. But it is not necessary to have genius in order to turn out very fair work; work which is quite capable of giving a great deal of pleasure, much more than that afforded by the efforts of genius when misdirected and ill-applied. "If you have great talents," says Sir Joshua Reynolds, "industry will improve them; if you have but moderate abilities, industry will supply their deficiency. Nothing is denied to well-directed labour; nothing is to be obtained without it .... I will venture to assert that assiduity unabated by difficulty, and a disposition eagerly directed to the object of its pursuit, will produce effects similar to those which some call the result of natural powers." Moderate powers of imagination will grow stronger by practice, by observation, and by discipline. They can, in short, be educated, like any other faculty. The other necessary qualification, knowledge, depends on the student's own industry, assisted by proper teaching, and this assistance you now propose to give him. Some things he will learn from books; the history of his art can be acquired only by reading, and some knowledge of it is, of course, indispensable, while, if he has time for it, he cannot know too much. But let him be on his guard against thinking that an historical knowledge of art will do anything of itself to make him a better architect. "A perfectly illiterate man," says Sir Joshua, "will never make a great artist"; but, all the same, a man may be a very good artist without being a man of letters. It is impossible that every student of architecture should attain the same literary culture, nor is it necessary. No doubt the more you love your art the more curiously will you study its history; but do not suppose that by learning the names, dates, and history of the authors of the buildings of the past you are studying architecture. You are merely following an interesting and natural course of antiquarian research, which it is most highly desirable that you should follow; but take care to disabuse yourself of the notion that it will help you in the least degree to be a better architect. Not that I would in any way dissuade you from these studies if you have time and taste for them. They are not architecture, it is true; but, at the same time, if you are nothing but an architect you will be a very dull fellow. Only distinguish carefully in your mind between the study of your art and the study of its history and antiquities, which is a totally different pursuit. As an art-student you must of course understand the sequence of styles, and their characteristics, how they grew out of one another, and, in their turn, developed into something new; but in that capacity you will have nothing to do with the social history of the age of which they formed the outward expression. Your business is with the value of ancient buildings as works of art; if you admire them, analyse the causes which make them beautiful; if you are disposed to criticise them, do not be deterred by any reverence for their antiquity, but judge them fairly to the best of your powers. Look at them with your eyes open, appraise them without prejudice, try to understand them without being blinded by the charms of old association and historic interest, and in that way you will get from them all the help they are capable of giving you in your architectural training. In short, be an artist first and an antiquary afterwards, remembering that your vocation is not the study of the art work of the past, but the creation of works of art in the present.

(*To be continued.*)

HUDSON AND KEARN'S DIARIES.

EVEN without a reminder there is one thing that every architect and builder never fails to do before he shuts up for the Christmas holidays—next, of course, to renewng his subscription to the BUILDING NEWS for 1892—and that is to order one or other of the admirable diaries and registered date indicating blotting-pads for the coming year. We have probably a greater choice of these office companions than most people; but for the past seventeen years all others have given place to Hudson and Kearn's for use on our desks. The paper is of the best, the information of the latest, and year by year every opportunity is seized by the publishers of anticipating any possible use to which the architect or business man can put a diary or desk-pad.

The Municipality of Bilbao are about to invite engineers to submit preliminary plans for a system of sewers to prevent the pollution of the river Nervion. The best four plans will receive premiums varying between 10,000 and 1,000 pesetas (£4,000 to £400). Five months are allowed for the preparation of the plans.

The Blackpool Tower Company have completed the purchase of the Aquarium site, and possession of the land and buildings was formally handed over to them on Friday. Owing to a firm having failed to fulfil their agreement, the Tower Company have saved over £21,000, and the actual price paid for the site is £72,800, instead of £94,000, as stated in the prospectus. The contract for the foundation works has been let to Mr. Robert Neill and Sons, contractors, Manchester, and operations were formally commenced on Monday. Messrs. Maxwell and Tuke, of Manchester and Blackburn, are the architects.

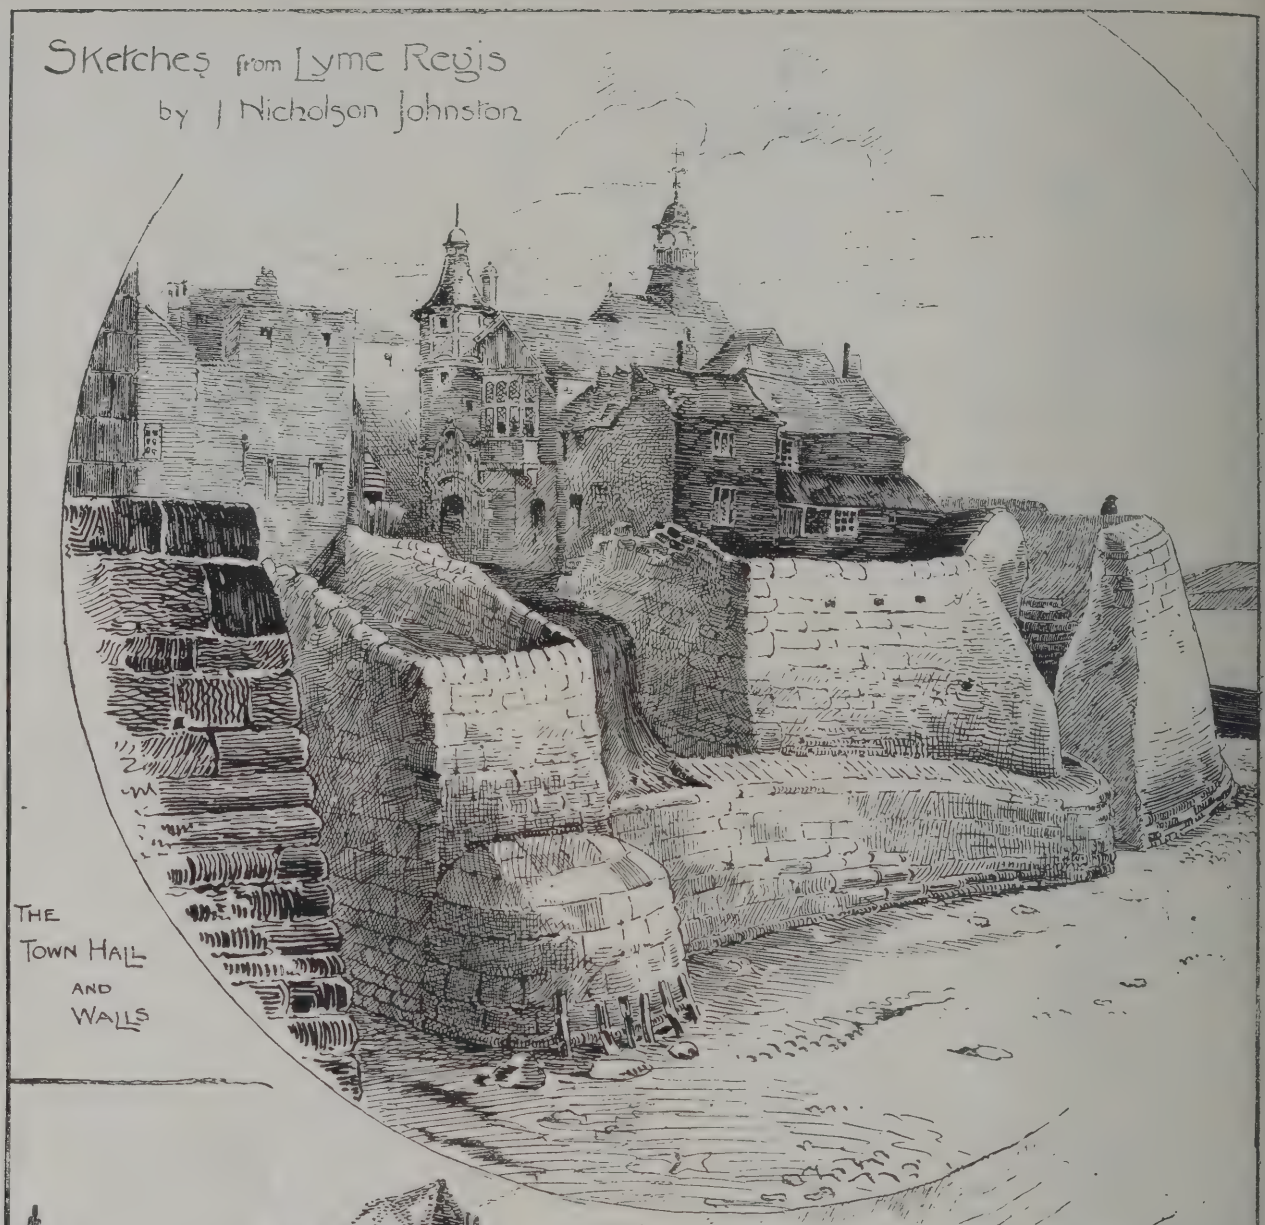
CHIPS.

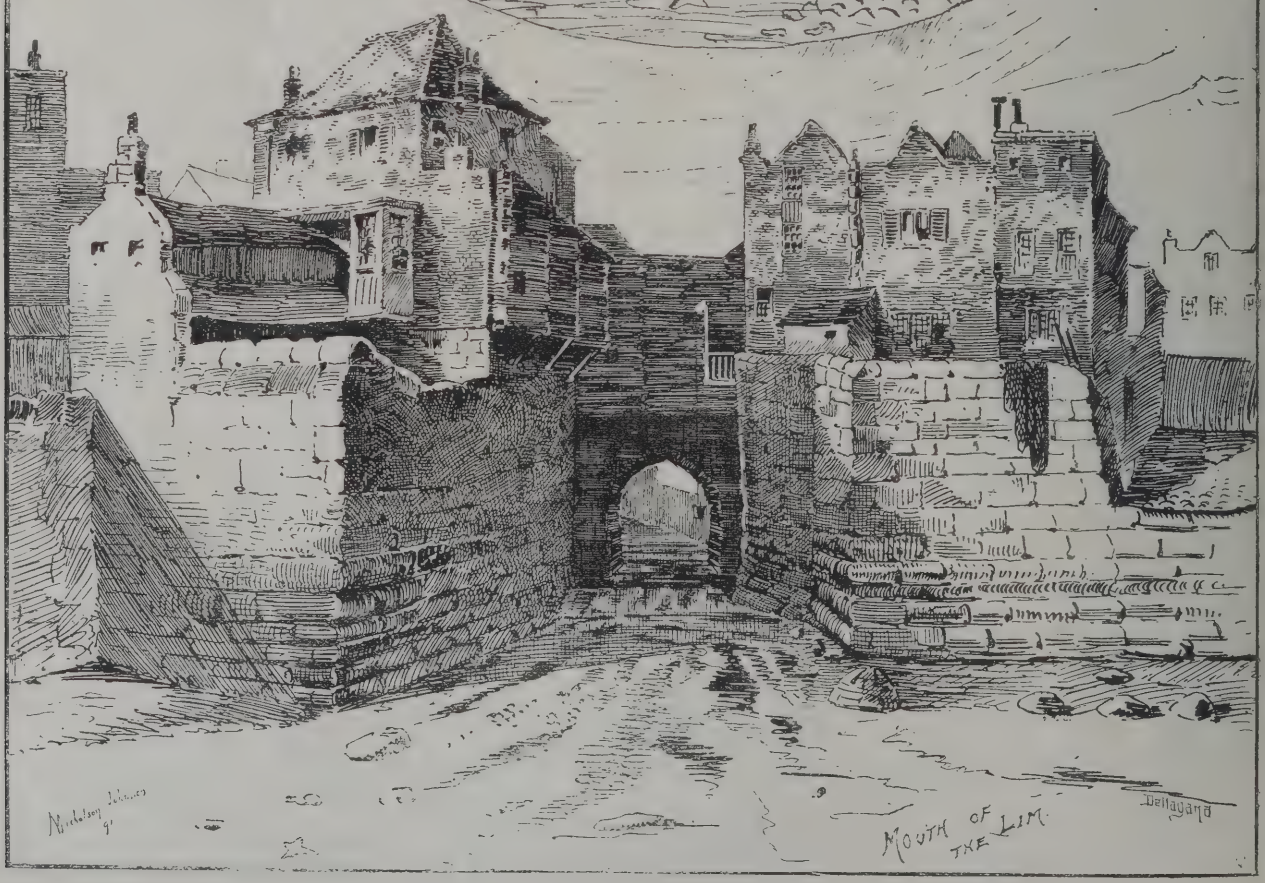
The widow of the late George Vulliamy, for many years architect to the late Metropolitan Board of Works, died at her residence at Burnt Ash Hill, Kent, on the 10th inst., aged 69 years.

St. Mark's Church, Fitzhugh, near Southampton, was consecrated on Tuesday week. It has been erected by Messrs. Joseph Bull, Sons, and Company, of Southampton, from designs of Messrs. J. E. K. and J. P. Cutts, of London. It is of red brick with Bath-stone dressings externally and internally, consists of nave and side aisles, separated by stone columns and arcades. It provides accommodation for 708 worshippers. There is an organ chamber, but the organ has yet to be provided.



Acting on the recommendation and report of Mr. James Mansergh, C.E., the corporation of Ipswich have unanimously decided to promote a Bill in Parliament for the purchase of the waterworks from the local company. The price to be paid is £222,000, equivalent to 28 years' purchase.

The town council of Heywood, Lancs, have decided to institute a competition for plans for a technical school, and to offer premiums of £20, £10, and £5 for the three selected designs.



At Drapers' Hall yesterday (Thursday) the freedom of the Fanmakers' Company was formally presented to Lady Charlotte Schrieber, in recognition of her efforts to promote the fan industry. Lady Schrieber has written two large volumes on English and foreign fans, and has handed over her magnificent collection of fans to the South Kensington authorities in trust for the nation.

'OND PREMIATED DESIGN FOR THE NEW TOWN HALL, BATTERSEA.—HOLY CROSS ABBEY, COUNTY TIPPERARY.—NEW CHURCH, HEAP BRIDGE.—THE WEST WINDOW, S. MICHAEL'S CHURCH, NEWCASTLE-ON-TYNE.—ADDITIONS TO GROVE HOUSE, HARROGATE.—FARMSTEAD, STANWAY MANOR, SHROPSHIRE.—SKETCHES FROM LYME REGIS.—THIRD PREMIATED DESIGN FOR BATH MUNICIPAL BUILDINGS.

Our Illustrations.

BATTERSEA TOWN HALL.

We illustrate to-day Mr. H. A. Cheers' design, which the second premium was awarded in his competition. Mr. Mountford's, the selected design, was given by us last week.

HOLY CROSS ABBEY, CO. TIPPERARY.

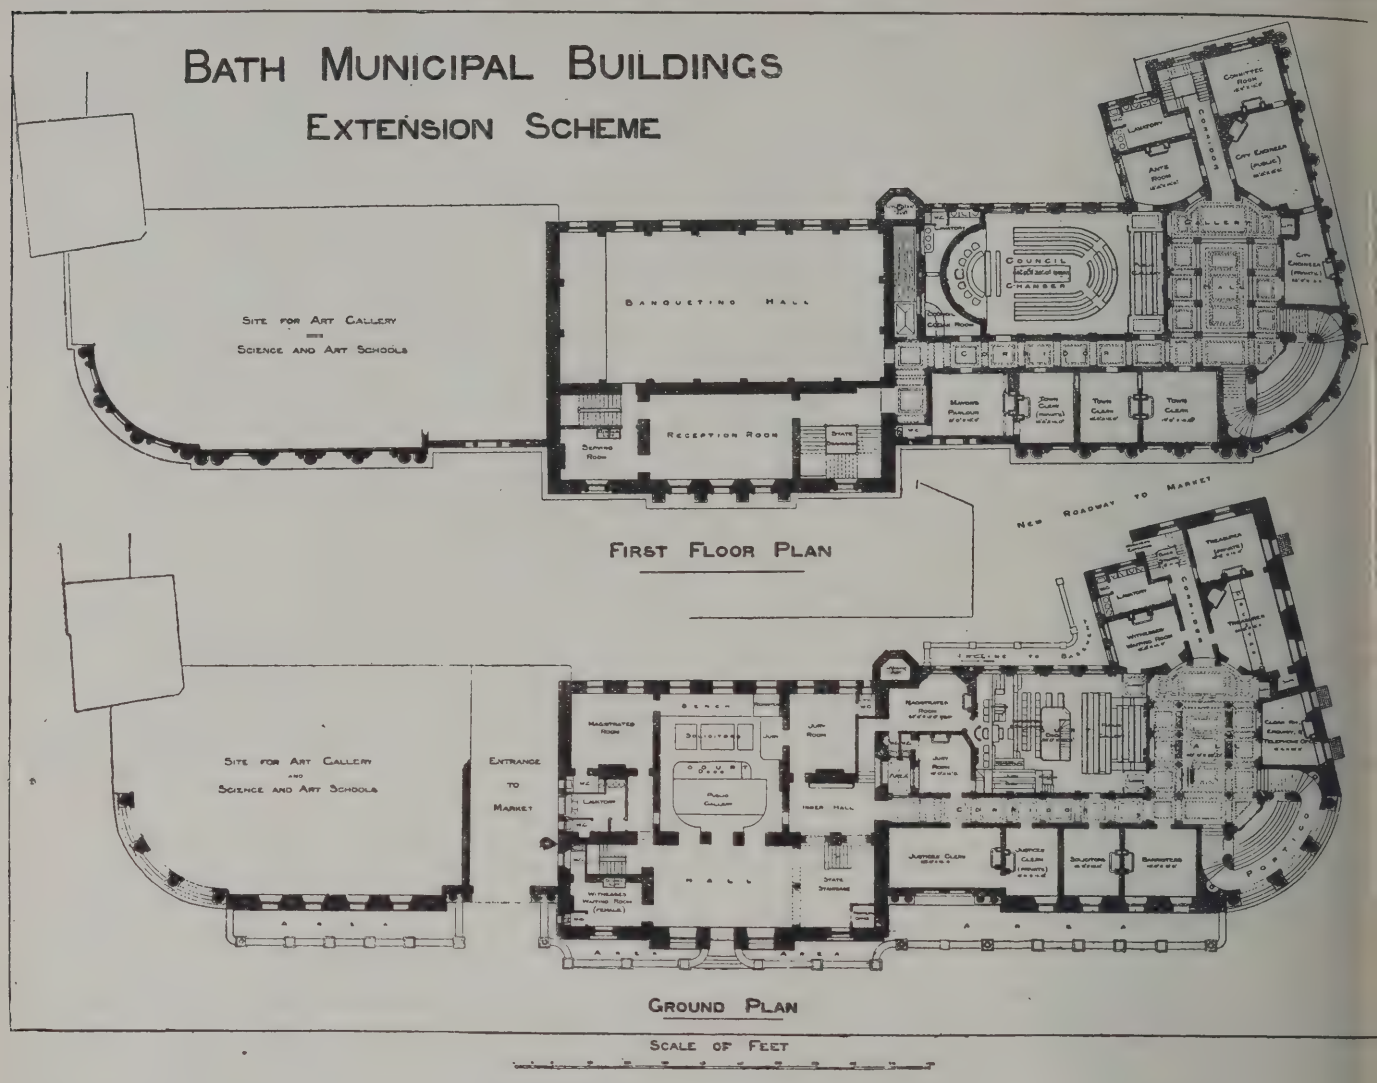
The Abbey of Holy Cross is beautifully situated on the banks of the river Suir, between Cashel and Thurles, about seven miles from the former and three from the latter. The author of "Monasticon Hibernicon" informs us that "the Abbey was founded in the year 1182, by Donogh Curbragh O'Brien, King of Limerick, in honour of the Holy Cross, St. Mary, and St. Benedict, for the monks of the Cistercian order." Mr. O'Halloran, the antiquarian, states that "this Abbey was erected in honour of a piece of the *True Cross*, which Pope Pascal II. sent as a present to Morough, King of Ireland [father to the above Donogh, and grandson to the famous Brian Boroimhe], in the year 1110." However true the account may be as to the gift of the relic by the Pope, there is every reason to doubt its accuracy as to date. A well-known Irish antiquarian, referring to the foundation of the monastery, observes that, "from the original charter, still in existence, it was founded by Donogh, King of Limerick, as late as 1182, at which time it was richly endowed with lands for its support by the founder, who further ordered that this monastery should have and enjoy all chartered rights, liberties, and freedom, as appears by the record of the 20th of Edward I., A.D. 1320. The above-mentioned charter of King John was confirmed by Henry III., who took this monastery under his protection; again by Richard II., 1395; and, in 1414, James, Earl of Ormond, and the Deputy Thomas le Boteller (or Butler), prior of St. John of Jerusalem, further granted the protection of the Crown to this monastery. Thus protected and fostered by royalty, the Abbey became one of the most magnificent in the kingdom. The lands belonging to it constituting an earldom, its mitred abbot was styled Earl of Holy Cross, and he was usually Vicar-General of the Cistercian order in Ireland." This abbey is stated to have been an offshoot of the Abbey of Maig in the County Limerick, and was afterwards subjected by the Abbot Clairvaux to that of Furness in Lancashire. The same learned antiquarian further adds that "William O'Dywer was the last abbot, and, after the dissolution of the monasteries, Holy Cross, with its appurtenances, was granted by Queen Elizabeth, in 1563, to Gerald, Earl of Ormond, *in capite*, at the annual rent of £15 10s. 4d." It appears from Camden and others that pilgrims of every class used to resort to this abbey, from reverence to the holy relic said to be preserved there; and we are told that, in the year 1559, the famous rebel O'Neill made a pilgrimage to its shrine, as did one of the Desmonds in 1579. The architectural character of the building is remarkably fine, and is considered by many to be one of the best remains of Middle-Pointed work to be found in Ireland. The abbey church is cruciform in plan, and consists of chancel, choir, nave, north and south transepts (with two chapels opening off each of the latter), aisles to choir and nave, and lofty tower at the intersection of the cross. The monastic buildings on the south side covered a considerable area, but they are for the most part very ruinous and dilapidated, and completely enmantled in ivy. The chancel is 23ft. 9in. long, 23ft. wide, and about 28ft. in height, having groined roof with moulded ribs, some of which rise diagonally from the sides and angles, and finish on gracefully-pointed corbels. The east window is a four-light one, with running flamboyant tracery, of a not uncommon design. Similar tracery may be found in Holyrood (or Cross), Scotland, Patrick Brompton, Yorkshire, and other churches. Under the east window, and about 1ft. from wall, are the remains of one of those old stone high altars, so frequently found in the abbey churches in this country; it is 10ft. long, 3ft. 6in. broad, and about 3ft. high. Over the chancel was a room, formed of necessity between the curved stone roof of chancel and the roof timbers; this may have been used as a dormitory—a not uncommon occurrence in ancient Irish abbeys. Upon referring to the east elevation it may be seen that there was a curious and novel passage on the east elevation, over the chancel window, about 1ft. 9in. wide, supported upon arches resting on corbels, and projecting about 9in. from outside face of wall. The plan of tower is a parallelogram, 23ft. by 13ft. 6in., and is supported on four Pointed arches, having similar groining to that of chancel, and rises to a height of 58ft. 9in., and is ascended by means of a small circular stone stair in N.E. angle, from level of room over chancel. The choir appeared to have been carried westward of the central tower for about 31ft., where a gable, rising the whole height of the building, separated the choir from the nave. The dividing wall and arches bear every appearance of a later date, which would suggest that the choir had been extended beyond its original proportions. The nave, or portion westward of the wall and arch just mentioned, is 22ft. 9in. wide, 60ft. 6in. long, bays on each side with Pointed arches. The principal entrance was from a door in the west end, and under the large west window, which is of much more recent date than the gable. The north aisle was lighted by four windows of a decided Late Perpendicular character, which would suggest that this portion is of much more recent date than the other. However, the windows throughout the building have evidently been so altered from time to time, to suit the various changes in styles which have taken place since the foundation of the abbey, that they give very little clue to the date of the structure in which they are inserted. The south aisle is without windows, except one in west gable. A door at either end, one of which is of a Norman character, leads into the monastery ground. These doors originally opened into a cloister, for the "Monasticon Hibernicon" informs us that a certain abbot built one adjacent to this aisle, but not a vestige of it now remains. The south transept, like the choir, nave, and aisles, was without groining. A flight of steps, rising on west wall of this transept, led to dormitories and other monastic rooms. Under these steps is a secret underground passage. Opening off south transept are two chapels, each about 10ft. 6in. by 8ft., with arched and groined ceiling, corresponding with those over chancel and tower. Between these chapels is a space formed by a double row of pointed arches, supported on twisted pillars, about 2ft. 6in. from centre to centre. This space is supposed to have been used for the purpose of "waking" the bodies of departed monks. This is a curious and interesting architectural feature which is not to be found in any other monastic ruin in this country. Over these chapels is a dormitory, with small window looking to transept, and two similar openings to the east elevation. These latter are not visible from the outside, being completely enveloped in ivy. The north transept has a groined roof of similar character to those of church and tower, though differing slightly in design from either. Opening off same are two other chapels, each about 12ft. by 9ft., with a groined roof and moulded ribs as on south chapels. Over these was a dormitory, corresponding with that over south side, and was approached by means of a small winding stone stair, constructed in the thickness of the wall in N.E. angle of north transept. The difference of the work in this monastery is very remarkable. Nothing could have been more highly finished than the chancel, tower, north transept, and adjacent chapels, which are all built of black marble and limestone; and in many cases these portions are in such good preservation, and are constructed of such durable materials, that the mouldings are as sharp and fresh as when executed, and in many places still bear the mark of the mason's chisel. But while the more sacred portions of the building were so well cared for, the remaining parts were strangely the reverse, being generally of the rudest and roughest rubble masonry; and yet a gracefulness of outline and a rustic simplicity pervade these weather-beaten and ivy-clad old walls, from which not even the coarseness of the materials nor the rudeness of the workmanship can in the least detract.

Samuel P. Close, Belfast.

DESIGN FOR CHURCH AT HEAP BRIDGE.

The original drawing, which was exhibited at the Royal Academy this year, was submitted in the competition for this church and placed second. It will be seen that simplicity and quaintness are its chief characteristics, and its suitability for a hilly site, such as the one it was intended for, may also be noticed. The seating accommodation is 330. The design is by Messrs. Preston and Vaughan, of Diocesan Chambers, Manchester.

WEST WINDOW, ST. MICHAEL'S, NEWCASTLE-ON-TYNE.



The subject of the window illustrated is "The Parable of the Sower," which runs through the entire four upper lights. In the first is the figure of Christ, garbed in ruby and white, emblematic of purity and divine love, in the act of sowing the good seed. In the two centre openings is a group of angels, clothed in white draperies with rich golden diapers, bearing sickles in their hands, and descending through the heavens to the corn-crowned earth which lies beneath them bathed in radiant sunshine. In the sinister light is an angel of surpassing beauty and sweetness, in a robe of olive-green, with an overcloak of white diapered in gold, leading a young child to the gates of paradise. Along the base of the group run the texts, "He that soweth the good seed is the Son of Man," "The harvest is the end of the world, and the reapers are the Angels." In the lower lights are represented four individual subjects—viz., "Christ changing the Water into Wine," "Christ blessing little Children," "The Agony in the Garden," and "Christ meeting His Mother on the way to Calvary." The tracery is filled with an angelic host, bearing scrolls and emblems. The work is from the studio of Messrs. Atkinson Brothers, Newcastle-upon-Tyne. Messrs. Dunn, Hansom, and Dunn are the architects.

GROVE HOUSE, HARROGATE.

The illustrations, which are from drawings which were exhibited in this year's Royal Academy, show the additions which have recently been made to the residence of Mr. Samson Fox. Mr. T. Butler Wilson, of Leeds and Harrogate, is the architect.

FARMSTEAD, STANWAY MANOR, SHROPSHIRE.

These farm buildings have recently been erected for Mr. F. W. Webb, the eminent and well-known railway engineer, on his estate at Stanway Manor, near Rushbury. The chief object in the design has been to economise labour and to provide premises as perfect as possible for their purpose. The general arrangement of the buildings will be seen from the accompanying plan and bird's-eye perspective view. The covered yards are a feature in the design, and are now acknowledged by all practical farmers to be very desirable for the health of the stock and for the increased quality of the manure. The yards are covered with 1in. red deal boards, soaked before fixing in a solution of creosote, and placed with $\frac{1}{8}$in. spaces between the boards. Each board is grooved on the top side near both edges, the grooves serving to convey the rainwater to the eaves gutter. The open spaces between the

boards allow for ample ventilation of the yards, and owing to the upward draught through the spaces, very little water finds its way through. The non-conducting quality of wood secures a much more even temperature in the yards than would be the case if either slate or corrugated iron were used for the covering. An 8-horse steam-engine provides the power for preparing the food, and serves to drive the threshing machine which stands in the barn alongside the stackyard. The engine is also used to saw the wood used on the estate. Great care has been taken to provide against rats and other vermin, there being no ceilings or hollow walls, and the floors are concreted under the paving. Tramway-lines are laid from the food-mixing house along the main feeding passages. The walls are built of brick, and the roofs, with the exception of the covered yards and stack stands, are of red tiles, the ridges being specially ventilated. The timber used throughout is red deal. The necessary accommodation is provided for a farm of 500 acres, and includes for about 100 head of horned cattle, 9 horses, and 20 pigs. The fittings throughout are of iron, and were supplied by Messrs. Musgrave and Co., of Dublin. The works have been carried out by Mr. J. Gethin, builder, of Shrewsbury, from the designs and under the direction of Mr. John Brooke, A.R.I.B.A., architect, of Manchester.

SKETCHES AT LYME REGIS.

Lyme is an interesting little town in Dorsetshire, on the sea at the deepest part of the Great West Bay, whose extreme points are Portland Bill and the Start. It is charmingly unconventual and old-fashioned. Perhaps the seven miles of road between it and Axminster, the nearest railway station, have kept it behind the times. Long may it remain so. It was in a flourishing condition in the time of Edward IV., for it furnished four ships and 62 marines at the Siege of Calais. It sustained a severe siege during the Civil Wars, being garrisoned by Parliamentarians and besieged by troops under Prince Maurice from the 20th April to 16th June, 1644. Lyme became famous in 1685 as the landing place of the Duke of Monmouth. One of the principal features of the place is the Cobb, a small harbour which gives shelter to fishing vessels and yachts. It is of great antiquity, but has changed its shape many times, having been rebuilt from time to time. The town takes its name from the small river which finds an outlet into the sea under the picturesque archway shown in the sketch. This archway is also of great antiquity. Right and left of the mouth of this stream stretch the old sea-walls, and the comparatively new town hall makes a picturesque crowning feature. At the back of the town, and round the sweep of the bay, the ground rises in natural terraced slopes to a great height. On one side the famous landslip, in summer gorgeous in colour, when gorse and heather and wild flowers heighten its wild beauty. Seen from the sea on a hot summer's day, with a perfectly blue sky overhead, and a sea as blue as the sky, Lyme Regis and its surroundings has an old-fashioned, peaceful beauty of its own, and rejoicing that the railway (and the cheap tripper) are seven miles off, one hopes that they may remain there.

J. Nicholson Johnston.

THIRD PREMIATED DESIGN FOR THE BATH MUNICIPAL BUILDINGS.

Thanks to the courtesy of the architect, Mr. T. B. Silcock, F.S.I., we are enabled this week to give a perspective view and plans of the design to which the third premium has been awarded in the competition for the new municipal buildings at Bath. A description of the design will be found elsewhere, in our review of the competition. We shall give the first and second premiated designs shortly.

The portrait of Sir Henry Watson, of Sheffield, by Mr. Herman Herkomer, which it is proposed to present to the Cutlers' Company, has been completed. The sum subscribed amounts to £570.

CHIPS.

The funeral of the late Mr. W. A. Goss, builde and contractor, of Torquay, took place on Wednes day week at Torquay Cemetery. The funeral pro cession was headed by members of the local lodge o Freemasons, of which deceased was the olde member at the time of his death; the carriage numbering 21, followed. Mr. Goss erected severa large public buildings and villa residences i Torquay. He had also taken an active part i public affairs, and was a member of the Local Boar from 1860 to 1866. Mr. Goss, who leaves a widow two daughters, and three sons, was 61 years of ag

The Adelphi Hotel at Liverpool, adjoining th Midland Central Station, was reopened on Saturda after having been remodelled, from plans by M C. Trubshaw, the architect to the Midland Railwa Company.

The death is announced from Landport of M James Hunter in his eighty-fourth year. Th deceased was apprenticed to Mr. Chubb, the founde of the well-known firm of lockmakers of Londo and Wolverhampton, and for many years wa manager of Messrs. Chubb's works at Wolver hampton. In 1850 he was presented with a silve medal for making some of the smallest locks pro duced at that time.

The city council of Amsterdam has granted subsidy of £41,000 towards the building of a ne art gallery, which will be erected at the back o the State Museum, built eight years ago from th designs of Mr. P. J. H. Cuypers. A donation fo the same object, amounting to £12,500, has bee received from the Van Eeghen family. All furthe expense incurred will be borne by the city treasury

The sanitation of Wellington College, and th cause of the development of the epidemic of throa affection which has lately occurred there, have bee placed in the hands of a commission composed o Mr. Baldwin Latham, C.E.; Mr. Rogers Field C.E.; Dr. Bristowe, F.R.S.; and Dr. Woodforde the county medical officer of health.

The partnership between H. Lee, E. H. Lee, an A. Grace, under the style of H. and E. Lee, War wick-street, Regent-street, W., and Great Church street, Hammersmith, builders and contractors, ha been dissolved.

WAYSIDE NOTES.

COMPETITIONS are not plentiful just now, and I should imagine that competing architects are rather "slack." There has been no plethora of advertisements lately, and what work of this kind has been offered to the profession has not been of a very extensive character. The new technical and public library required by the corporation of Darwen will, therefore, be welcomed as a competition of some moment, and promising well. Those who have followed the course of events of late will have endeavoured to qualify themselves for competitions for buildings of this nature. New arrangements for the promotion of technical education must shortly give a yet greater impetus to the building of the requisite institutes and colleges.

In addition to a demand for technical institutes in the provinces, there may be, in the near future, a "boom" in village-hall building. Politicians are just now concerned—of course, in a *wholly disinterested way*—about the entertainment and recreations of dwellers in villages and the rural population generally, and I see that the suggestion was made at the recent meeting of agricultural labourers at the Memorial Hall, Farringdon-street, that "the village hall" would be an institution likely to render the leisure hours of the rural labouring population more enjoyable. Without being deceived by the arguments of vote-hunting politicians, who say much about the agricultural labourer that must cause this worthy gentleman to laugh in his sleeve, we may yet believe that the village hall is an admirable institution, and worthy of every effort to advance and promote its usefulness. If, therefore, the "progressive" party should successfully bring a Bill into Parliament providing for the erection of village halls, to be maintained, say, by a tax on the ground-landlords of London, or to be built and equipped—including a new set of billiard balls once a year—at the sole expense of the village squire, the architectural profession would do well to turn their attention to this branch of design.

A "Constant Reader" sends me a cutting from one of the Brighton papers with an advertisement of the Guardians of the parish of Brighton respecting their competition for new public offices for the transaction of poor-law business. The invitation to compete was addressed only to Brighton architects, and "terms" were demanded. Touching which, "Constant Reader" writes: "The difference between our corporate bodies is refreshing. The school board and the corporation have decided to insert in all their contracts a clause similar to the London County Council, viz., that the workmen shall be paid the standard rate of wages, &c. The guardians, on the contrary, are, by asking for terms, endeavouring to reduce the standard rate of wages for the architects. Thus the uneducated (or only partially educated) workman is to be protected, and the educated architect is to have his wages lowered by competing against another. They (the guardians) seem to forget that cheap work, and more especially cheap professional work, is, as a rule, bad."

The Brighton authorities are certainly inconsistent. The poor architect wants protecting as much as the workman. But "Constant Reader" must not look for consistency; he should remember, too, that this is the age of the "working man." Few people, moreover, seem to grasp the truth of the principle expressed in the saying that "work done for nothing is worth what it is done for." I think that there is one point about things pertaining to an architect's business on which all who may differ on other questions will agree, viz., that it is impossible to reduce the amount of remuneration received for architectural work without rendering such work unprofitable, especially in cases where much elaborate detail draughtsmanship is required. Some few clients may see that this is the truth; but the mass of the public cannot appreciate the point. They, therefore, would believe that the amount of remuneration for architects might safely be reduced, and this being the case, I re-urge what I have often said, that it is of vital importance to maintain *by our own endeavours* the present standards. Thus, if the Brighton architects had stood firm, and all refused the work offered except on the recognised scale of charges for professional assistance, a decided blow would have been dealt to an enemy who is very insidiously creeping up in the rear. I do not know what resulted from the advertisement my correspondent alludes to; but can hardly hope that there was enough backbone at Brighton to refuse the work, except on the usual terms.

Replying to Sir J. C. Robinson's letter respecting the old grammar-school buildings, the town clerk of Totnes has written that the school has been altered and reconstructed so often that no part of the original building now remains. In the cellars, however, are remains of the old town wall, and these remains are to be preserved under the new scheme for building police offices. Moreover, the present buildings of the grammar school are not to be wholly pulled down; but the offices will be arranged in the old building, the scheme being one rather of adaptation than reconstruction.

A paragraph in Monday's papers described an interesting discovery during the restoration works at Crowland Abbey. In the course of the removal of a decayed stone, it was discovered that the walls between certain buttresses were mere casings and covered an older wall, which, being laid bare, appears to have been part of the original building dedicated to St. Martin. All will be glad te hear that the works at old Crowland have been carried forward most satisfactorily. The tower, it is said, is now safe from its very foundations, which seem to have been underpinned. The arches under the spire have been made secure, and the spiral staircase, the porch, and the king's chamber restored. The Rev. T. H. Le Bœuf, the rector, who has been so enthusiastic in his work, is now about to undertake the preservation of the bell-chamber. Then, when this is finished, the Early English doorway opening into the nave, with its interesting legendary sculptures, will receive attention. This last work, it is said, is of a pressing character, as the effects of rain and frost will, if not soon arrested, "obliterate every trace of one of the most remarkable relics of ecclesiastical art in the country."

Grand old Bicker Church, Lincolnshire, is to be restored, if sufficient funds are forthcoming. A movement for the work is on foot, and subscriptions have been promised.

Mr. White's paper on "The Architect and His Artists" seems to me to be a most practical contribution to many of the vexed questions of the day. What does the artist-architect say to only receiving 2 per cent., and letting the other 3 per cent. go to the constructional engineer and the building surveyor? I rather think that this sort of suggestion is calculated to arouse those falling into a morbid condition, and blindly worshipping high architecture. Mr. White's arguments as to the question of provisional amounts are also unanswerable, at least as regards the majority of cases. Where the provisional amount is not inserted, merely to save the architect troubling about details, and is paid to some specialist whose assistance is absolutely indispensable, then it is in all ways justified. A provisional amount for ironwork is not justified, because an architect should, in these days, be himself an accomplished constructor in iron and steel. If otherwise, he is incompetent to deal with the material of the age. A provisional amount for the supply of a steam-engine is another matter. The architect is not in any sense of the word a mechanician. A provisional amount for an expensive set of machinery for, say, baths, is again another thing. If competent, the architect will know what machinery, boiler, engines, &c., is required, and be able to specify details himself, thus saving the labour of another brain and consequent expense to the client. It is a grand general rule I think to have no provisional amounts in a bill of quantities, unless it is *absolutely* necessary. Every provisional sum means increased relative expense to the client, and has other objections. Many doubtless provide these sums, so that they may be sure that certain goods are supplied and fixed, but this is a feeble arrangement. Specify something, and —as the advertisements say—"see that you get it." Those who have not the strength of mind and power of moral persuasion to see their specifiation duly honoured, are not worthy of the designation, "architect"—art, craft, or otherwise.

GOTH.

Engineering Notes.

SOCIETY OF ENGINEERS.—The thirty-seventh annual general meeting of the Society of Engineers was held on Monday last at the rooms of the Society, 17, Victoria-street, Westminster, S.W. The chair was occupied by Mr. William Newby Colam, president. The following gentlemen were duly elected by ballot as the council and officers for 1892, viz.:—As president, Mr. Joseph William Wilson, Jun.: as vice-presidents, Messrs. William Andrew Valon, George A. Goodwin, and Chris. Anderson; as other members of council, Messrs. R. W. Peregrine Birch, Charles Claude Carpenter, Henry Faija, Charles Gandon, Charles Nicholson Lailey, Thomas Bell Lightfoot, William George Peirce, and Arthur Rigg; as hon. secretary and treasurer, Mr. Alfred Williams; as hon. auditor, Mr. Alfred Lass (Messrs. A. Lass and Co.) —The annual dinner was given at the Holborn Restaurant, on Wednesday evening, December 16th. The president, Mr. W. N. Colam, occupied the chair, and amongst a large company present were the Right Hon. Sir Lyon Playfair, K.C.B., M.P., Sir Robert Rawlinson, K.C.B., and Mr. W. H. M. Christie, M.A., F.R.S. (hon. members), General Webber, C.B., Mr. T. de Courcy Meade (President of the Incorporated Association of Municipal and County Engineers), Mr. W. Worby Beaumont, Mr. J. W. Wilson, jun. (president elect), Mr. W. A. Valon (vice-president), Mr. Henry Adams, Mr. Jabez Church, Mr. Chas. Gandon, Mr. Perry F. Nursey, and A. T. Walmisley (past presidents), Mr. Chris. Anderson, Mr. R. W. Peregrine Birch, Mr. C. C. Carpenter, and Mr. H. Faija (members of council), Mr. Alfred Williams (hon. secretary and treasurer), and Mr. G. A. Pryce Cuxson (secretary). The loyal and patriotic toasts usual on such occasions having been proposed and honoured, the toast of the evening, "Success to the Society of Engineers," was proposed in felicitous terms by Sir Lyon Playfair, who coupled with it the names of the president, the hon. secretary and treasurer, and the secretary. The President, in the course of his reply, said he thought that the ever-increasing success of the Society of Engineers was mainly due to the care bestowed in the selection of papers read, and the opportunities given to the younger members of the profession to take part in the discussion; to the summer visits of members to works of engineering interest, at which opinions were freely exchanged with great mutual benefit; to the honorary secretary and treasurer, Mr. Alfred Williams, whose long experience, commonsense, and watchfulness were invaluable; and, lastly, to the energy and tact of the secretary, Mr. Pryce-Cuxson. During the last year, he was glad to be able to say, the increase of membership had been about 8 per cent, and the attendance at meetings about 5 per cent. The visits during the past summer vacation had been very popular, as evinced by the unusually large attendances. He felt he could hardly too strongly impress upon the minds of the younger members the importance of attending such meetings. The vacancy amongst their honorary members occasioned by the lamented death of Earl Granville had been filled by the election of Sir George Berkeley Bruce.

The parish church of Great Plumstead, near Norwich, was entirely destroyed by fire on Tuesday morning, and is now a mass of ruins. The church, which was insured in the Norwich Union Office, was restored in 1876, the nave by voluntary subscription, and the chancel by the Ecclesiastical Commissioners.

The City Commission of Sewers have adopted an amended plan for completing the improvement of Ludgate-hill near St. Paul's-churchyard, and an arrangement for settling the claims of the freeholders and leaseholders, the former on the principle of give and take, and the latter by payment to Messrs. Howell of £36,000.

The students of the building construction class in connection with the Halifax Mechanics' Institute paid a visit to the extensive works of Messrs. Oates and Green, fireclay and sanitary tube makers, at Horley Green and Beacon Hill-road, on Thursday week. The visit was very much enjoyed by the students, who took a deep interest in the explanation made by Mr. Oates. On the motion of Mr. Goldthorpe, the teacher of the class, seconded by Mr. Bentley, the teacher of the machine-drawing class, Mr. Oates was thanked for his kindness.

Building Intelligence.

Dublin.—The new offices of the Ulster Bank in College-green were opened for business on Monday. The architect was Mr. Thomas Drew, R.H.A., the works being superintended by his assistant, Mr. R. C. Orpen, and the contractors were Messrs. Samuel H. Bolton and Sons, of Dublin and Rathmines. The building is Classic Renaissance in style, the front being divided into three bays by columns of the Roman Ionic order, raised on a basement level 25ft. high. The building is constructed of Irish materials, the facing stone being from the Ballinasloe quarries, and the dadoes and internal columns being of red marble from Cork, while Irish oak is employed for doors and panelling. The cash office is 78ft. by 40ft., and beneath it are the strong rooms and safes. The fittings in the office, which is lighted by a glass dome, are of mahogany, carved by Messrs. Hems and Sons, of Exeter, and the wrought-iron grilles and panels throughout the building were executed by Messrs. Singer, of Frome. Mr. Sharp, of Brunswick-street, executed the stone carving, and the hydraulic lifts have been supplied by the American Elevator Co.

Leeds.—A new Wesleyan Sunday-school in Dewsbury-road was opened on Saturday. The site adjoins that of the chapel, built in 1888, and the architect for both is Mr. G. F. Danby, of Leeds. The buildings consist of a central assembly-room 65ft. by 35ft., seating 500 persons, with recessed platform at one end, and open-timbered roof 25ft. high to the ceiling. The room is lighted by large windows at each end, and by clerestory windows at the sides, filled in with tinted leaded lights. On either side of the assembly-room, and entered therefrom, are eight classrooms of various sizes; also a church parlour 29ft. by 18ft., and 15ft. high, with dressed and varnished roof and fireplace. At the rear of the school an infants' room accommodating 150 is placed, with raised gallery at one end. In the basement three additional classrooms, kitchen, apparatus room, and offices are arranged. All of the classrooms are fitted with electric bells, worked from the superintendent's desk. In addition to open fireplaces in several of the rooms, each room is warmed on the low-pressure hot-water system. The building is of pressed bricks, with stone dressings to harmonise with the adjoining chapel. The interior woodwork is of pitch pine, varnished. The work has been carried out by Messrs. P. Rhodes, T. Harrod, and J. Lindley. The cost of site, building, and furnishing has been £3,500.

CHIPS.

New classrooms in connection with Bunyan Meeting Sunday-school, Bedford, were opened by the Mayor of Bedford (Dr. Coombs, J.P.) on Thursday last, Dec. 10. The works have been carried out from the designs and under the superintendence of Messrs. Usher and Anthony, of Bedford, the architects, by the contractor, Mr. J. P. White, at a cost of about £1,300.

In connection with the architectural section of the Glasgow Philosophical Society, Mr. Alexander M'Ara read a paper to the members on Monday night on "Limes and Cements," with experimental tests.

The death is announced at Beaumaris, in his 78th year, of Sir Andrew Crombie Ramsay, LL.D., F.R.S., late Director General of Her Majesty's Geological Survey of the United Kingdom. Sir Andrew, who was president of the Geological Society in 1862-3, was the author of several works on geology and physical geography.

A meeting of the Civil and Mechanical Engineers' Society was held on Wednesday evening at the Westminster Palace Hotel, when the president-elect, Mr. A. A. Myall, A.M.Inst.C.E., read his inaugural address.

The joint present to the King and Queen of Denmark to be made by the Royal families of England, Russia, and Greece, on the occasion of their golden wedding, will take the form of a group of sculpture by the Danish artist Husselrüs, which will ultimately be placed in one of the public squares of Copenhagen. The plans have already been prepared. On a granite pedestal will be a bronze figure representing Denmark, surrounded by three bronze lions bearing the shields of the Royal houses of England, Russia, and Greece. Around the pedestal will be bronze medallions and portraits of the 51 children and grandchildren of the Royal couple.

COMPETITIONS.

Glasgow.—Mr. Waterhouse, R.A., has been engaged for the past few days in an examination of the competitive plans for the proposed museum, art gallery, and school of music about to be erected in Glasgow. The cost of the buildings is estimated at from £100,000 to £150,000, and under the conditions the designs were to be of such a character as to admit of extension to meet the growing requirements of the city. Sixty sets of plans were sent in, and the following short list has been selected:—Messrs. Malcolm Stark and Rowntree, Glasgow; Thomas M. Deane, of Sir Thomas N. Deane and Sons, Dublin; Treadwell and Martin, Pall-mall, London; John W. Simpson and E. J. Milner Allen, New Inn, Strand, London; John Honeyman and Keppie, Glasgow, two designs. The names are arranged in the order in which they stood on the list, not in the order of merit. The design of Messrs. Malcolm Stark and Frederick Rowntree is Classic in treatment, a feature being the central hall, which dominates the group of buildings from every point. Of Messrs. Honeyman and Keppie's designs, one is a free adaptation of Early French Renaissance, the other being severely Classic; in both the large hall occupies a central place, the museum being located to the east, and the school of art and picture-galleries to the west. A second competition will take place among the selected candidates, and the final decision is expected to be given by the month of March. The nucleus of the fund consisted of £48,000, the surplus from the late International Exhibition, in addition to which a sum of £53,000 has been subscribed.

Oswestry Municipal Buildings.—The last scene in this curiously-managed competition has just been reached, the town council having agreed to vote Mr. H. A. Cheers, of Twickenham, £300, which he has accepted "in full discharge of all claims." It will be remembered that the town council promoted a year ago a competition for plans for new municipal buildings, Mr. T. M. Lockwood, F.R.I.B.A., of Chester, being appointed as professional referee. Designs were duly received and adjudicated upon, and that by Mr. Cheers was selected, and was published in our issue of the 3rd January last. When tenders were obtained it was found that the cost would exceed by some £2,000 the stipulated outlay. It was ultimately decided that Mr. Bolton, the borough surveyor, should carry out the work according to Mr. Cheers's competition plans as modified under the supervision of Mr. Lockwood as consulting architect. Mr. Lockwood has since arranged to accept three hundred guineas from the town council, for which sum, it was stated, "he will undertake the preparation of drawings, specifications, and details, and will superintend the work of erection."

Oxford.—The five designs which Mr. Colcutt, the professional referee, has chosen for the final competition for the Oxford Municipal Buildings, out of the 135 designs sent in, have, we understand, been accepted by the town council. We are not at liberty to publish the accepted names at present.

In the course of the demolition of the remains of the ancient church of St. Martin's-le-Grande at Dover, on Saturday, the workmen came upon two chalk graves. Both contained human remains; and in one of the graves a beautifully wrought silver chalice and paten were found. The church of St. Martin's-le-Grande was built in the early part of the 7th century, on the foundation of older Roman baths.

The death is announced from Cairo of Emile Bayard, the distinguished French painter. Born at Ferté-sous-Jouarre in 1837, he had barely reached his 54th year; but twenty years ago he was named a Chevalier of the Legion of Honour, and promoted to the degree of officer in 1889. His best-known work is perhaps "Une Affaire d'Honneur" (1884). But his fame will mainly rest on his power as a book illustrator.

At Monday's meeting of the town council of Shrewsbury it was decided to adopt a revision of the accepted plans by Mr. J. Johnson, of Queen-Victoria-street, E.C., for the new public baths, which will effect a saving of £500 in the cost of erection, and diminish the cost of subsequent management. The first-class swimming-bath will be reduced in area to 2,250ft., and the second-class enlarged to 2,700ft., both being 30ft. wide. Private baths for both sexes will also be provided. The cost is now estimated at £6,500 with the alterations agreed upon.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Master Builders' Association.—The annual dinner of the Master Builders' Association took place on Thursday evening in last week at the Grand Hotel, Colmore-row. Mr. C. H. Barnsley, president, occupied the chair. Mr. J. J. Moffat, vice-chairman, in proposing "The City and Trade of Birmingham," said he was afraid they could not just now congratulate themselves on the state of trade in Birmingham. Mr. C. H. Barnsley proposed "The Birmingham Master Builders' Association," and expressed the opinion that the state of trade to-day was far more satisfactory than it had been for some time. It might be that more work had been the builder's lot, though he feared the scale of prices had brought very little margin of profit. He thought there should be a desire with them, as a trade, to obtain better prices. In connection with the association it had been arranged that the offices should be open for intercourse between the members of the trade, and the meetings would be of a social character. Mr. T. Rowbotham proposed the toast of "The National Master Builders' Association," to which County Councillor J. Bowen responded. Mr. Alfred Smith proposed the toast of "The President," to which Mr. Barnsley replied.

Carlisle Architectural, Engineering, and Surveying Association.—This association, which was formed some short time ago in the city of Carlisle, promises to become a successful and important body in the city if the interest and energy be continued with which it has started. The meetings are held fortnightly in the Town Hall, and on Tuesday week last the members listened to an interesting and instructive paper by Mr. H. Higginson, architect, of that city, illustrated by the oxyhydrogen limelight, the subject being "With the Society of Architects in Belgium." The inaugural address was given on Oct. 20 by the city engineer and surveyor, Mr. W. Howard Smith, A.M.Inst.C.E., and since that papers on the following subjects have been given, viz.:—"Cremation Considered Generally" and "The Heavier Class of Lifting Machinery and Computation of Strains." The papers yet to be given are:—"Sewerage and Sewage Disposal," "Rational Building," "Road and Street Formation," "Girder Work and Strains," "The City Building By-laws," "Gasholder Construction," and "The Sanitary Arrangements of Public and Private Buildings."

Cardiff Master Builders' Association.—The annual general meeting of the members of the Cardiff Master Builders' Association was held at the Angel Hotel on Wednesday evening week. There was a large attendance, the chair being occupied by Alderman David Jones. The report and balance-sheet for the year were presented and passed. They showed a satisfactory state of affairs, and gratification was expressed at the strength of the association, which now numbers close upon 50. Alderman David Jones was re-elected president, Mr. F. S. Lock vice-president, and Mr. S. Shepton hon. treasurer. The retiring members of the committee were also reappointed.

Manchester Architectural Association.—Owing to the fusion of this association with the Manchester Society of Architects, the members met together at dinner for the last time at the Grosvenor Hotel, Manchester, on Tuesday, the president, Mr. T. Chadwick, A.R.I.B.A., in the chair. The toast of "The Royal Institute of British Architects" was proposed by Mr. J. S. Hodgson, and responded to on behalf of the Institute by Mr. Lawrence Booth, F.R.I.B.A. Testimonials were then presented by the chairman to Mr. A. H. Davies-Colley, A.R.I.B.A., and Mr. J. D. Mould, A.R.I.B.A., on behalf of the members of the association. Mr. Davies-Colley has been treasurer of the association ever since its formation (a period extending over 16 years), and Mr. Mould has acted as hon. sec. for the past six years. The healths of both gentlemen were given with musical honours, and they responded. The toast of "The Past Officers of the Association" was proposed by Mr. T. Cook, and responded to by Mr. Frank W. Mee. "The Success of the Newly-constructed Manchester Society of Architects" was proposed by Mr. A. H. Davies-Colley, and responded to by Mr. P. E. Barker, A.R.I.B.A. The toast of "The Chairman" was then given, and the proceedings terminated.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and SIXPENCE for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

CHRISTMAS DAY.

CHRISTMAS DAY falling this year on Friday, it will be necessary to publish the BUILDING NEWS on Thursday, Dec. 24. All advertisements for the next number must therefore reach the office by 3 p.m. on WEDNESDAY next, instead of by 3 p.m. on Thursday, as usual.

The New Year's Double No.—It is respectfully intimated that all the space available for extra advertisements in the New Year's Double No. is full, and that no further applications can be entertained.

RECEIVED.—H. B. and T. Co.—J. B.—B. and P.—S. L. B T. and R.—J. W.—S. T.

"BUILDING NEWS" DESIGNING CLUB.

F. C. CALD-BEEK. (Yes, your drawing came in "too late." If you will address your contributions to the office of another journal it is only to be expected that they will meet with such a fate.)—JOHN STONE. (We will give the subject you suggest before long.)—Drawings received from "Cyclist" and "Sphinx."

Correspondence.

THE CRAFTSMAN-ARCHITECT.

To the Editor of the BUILDING NEWS.

SIR,—It was because I was hoping that the Society of Architects would develop into the kind of architects of which the late J. D. Sedding approved that I joined its ranks; but I find the same foolish professionalism there as at the Institute.

I think architects should in every way be encouraged to become builders—there would then be some hope for architecture. A builder known to have a knowledge of architecture, and to be in other respects capable, naturally gets more work than Mr. Buggins, *et hoc genus omne*. The class of people who wish to save the 5 per cent. paid to architects is a pretty large one. These people go direct to a builder. They like to get the art thrown in, so go to a builder who can draw, if they can find one; but these are at present very few and far between. I know of one who was a pupil of a well-known architect, and before succeeding to his father's building business, worked in one or two other offices.

I was wanting this builder friend of mine to become a member of the Society of Architects; but his being a builder was quite enough, and the S.A. would have nothing to do with him. I am pleased to find that builders are developing a knowledge of sanitary matters. This is, no doubt, brought about by the demand for builders with this knowledge.

There is also a demand for better-looking houses, so Mr. B. makes an effort at design. But this is not so easy a matter as acquiring a knowledge of sanitation, and builders will not be successful designers till, after a year at the bench, they spend a couple in an architect's office.

C. F. M.

ROGERS v. JAMES.

SIR,—I should be glad if you will allow me the opportunity of explaining several points in this case, raised in your leading article of this week's issue, and also in the letter signed "M. M."

First, as to the fees charged. I claimed £123 as a balance due to me; the original contract was for £1,900; but during the erection of the buildings many alterations had been made, by the desire of my client, causing a very complicated account of extras and omissions. The total cost of the work was about £2,500. Upon the building I charged 5 per cent., for omissions 2½ per cent., and for small decorative contracts, such as designs for mantels and over-mantels and over-doors, 10 per cent., and for drawing up the final accounts, 2½ per cent., which charge had been agreed upon; also £25 for a first set of designs (finished drawings), payment for which had been promised. The jury awarded me £58; how they arrived at the amount I cannot tell.

The counter-claim was not only for omitted concrete, but for such items as the following: I discovered, upon digging for the cellar, that we were coming to a spring, and I then, without consulting my client, who was absent, ordered the cellar to be carried down a foot less in depth, to escape the water. This was considered, and omitted for in the final accounts. A charge was also made against me for allowing the use of a felt damp-course instead of slate in a small portion of the building.

The whole amount allowed in the contract for concrete and digging was £63. This was only omitted in portions, and where there had been such omissions I allowed £82 for the cost of underpinning.

My final certificate showed a balance due to the contractor of £163. The balance sent in by him was over £700. The contractor's claim was contested, and resulted in a trial in the Court of Queen's Bench, when my final certificate was upheld by my client, and judgment given in his favour. He thus put in his pocket £82 by upholding my certificate.

Now, as to my negligence. When the omission of concrete was discovered, I made a searching examination of the footings, and wherever it had been omitted I found a thickness of from one to two inches that had been spread in the trench. This is a new method of building to me, but I am told that it is not an uncommon one. The architect goes on to the works, he sees concrete being prepared and laid in the trenches; but, in his absence, this thin layer can be spread, and unless he has cause to suspect the bona fides of the contractor or his workmen, and has some of the concrete picked up, he cannot very well detect it. I can understand that this may have been done without the knowledge or consent of the contractor. As you properly remark, the only remedy for this is to employ a clerk of the works.

I am not a member of the R.I.B.A., and have not, during the 25 years I have been in practice, had any reason held out to me that would pursuade me to join that body.—I am, &c.,

FREDK. ROGERS.

HOW LONDON COULD BE CLEARED FROM SOME OF ITS DISCOMFORTS.

SIR,—The fearfully polluted state of the Thames river, after over ten millions of money has been spent in trying to purify it, is still perplexing all thoughtful citizens; also London's smoky, foggy state of air, and unsatisfactory supply of water. Much has been said and written on these serious subjects, but no truly safe and unfailing way of attaining the desired state of the river, air, and water has ever yet been discovered.

I beg humbly to suggest the adoption of one way—indicated by our Almighty Creator's arrangement—put before us for attaining all these objects.

Inasmuch as the tide attains an average of about 38ft. in the Bristol Channel, only about 18ft. at London Bridge, by deepening the Thames to sea-level, through its most eligible branch into the Avon and on to the Bristol Channel, and self-acting flood-gates erected to open by the rising tide and close when the ebb began. By this means a continuous flow of about 10ft. in depth of the Atlantic water (over high water at the Nore) would enter the German Ocean if the inflow at the receiving end and the Channel conveying it to London-bridge are greater than the outflow at the mouth of the Thames. As the water would flow continuously through at the tidal speed of about six miles per hour, all sedimental matter lighter than water would be carried on to the German Ocean within the twenty-four hours, and sand, mud, &c., carried onward, scouring out the bed of the river continuously. And the smokeless Welsh coal being carried on the tide to all the towns, the present smoky atmosphere would be done away with; also all the springs down to the sea level would be laid open on each side, and conveyed by canals or pipes to supply superior blended spring-water to all the inhabitants.

The continual flow down the Thames will prevent the fogs from running up the up-tide, being stayed by the more rapid running outflow of clear Atlantic water, with shoals of fish from sea to sea, with abundance of crumbs from every table to feed them.

Much of the shipping carrying goods would discharge at the wharves where the railways crossed, to be carried to their inland destination; also the beds of building materials found made available for use throughout the valley by the cheap tidal conveyance; also a fair supply of health-giving sea air throughout.—I am, &c.,

PETER LOVE.

18, Ravensbourne-road, Catford, London, S.E.

CHIPS.

The Filey local board have adopted the final arrangements for the new sea wall and promenade. The Local Government Board has sanctioned a loan of £10,500 for the purpose. The plans of Messrs. Fairbank and Sons, of Westminster, S.W., and Driffield, have been adopted.

Additions have been made to the Somerset and Bath asylum, and special attention has been paid to the ventilation, which is carried out on the Boyle system, the latest improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The Duke of Grafton has been making considerable additions to the interior of Stony Stratford Church. The choir stalls have been rearranged, and the old pulpit and sounding board removed. The additions to choir consist of carved oak stalls, clergy desks, &c. The old pulpit has been replaced by a new one in oak, carved to match. This work has been carried out by Messrs. Jones and Willis, of London, under the superintendence of Mr. Gray, the resident surveyor.

A large block of offices is now being erected at the St. Vincent's Ironworks, Bristol, from the designs and under the superintendence of Mr. R. Milverton Drake, architect, 24, College-green, Bristol. The frontage is over 100ft., with a depth of 60ft. Doulting stone will be used for the two main façades.

Harry Dainton, a journeyman mason, aged 34 years, who drowned his wife in the Avon on the 8th of September, was executed in Shepton Mallet Gaol on Tuesday.

St. Paul's Church, Scotforth, near Lancaster, which has for some months been in process of restoration and enlargement, was formally re-opened on Tuesday. The cost of the work has been about £850. The accommodation has been increased from 300 to 435 sittings.

The Lichfield board of guardians are about to add an infirmary and dining-hall to their workhouse, from plans by Mr. W. H. Woodroffe, of London.

A small section of the Walls of Chester opposite the Infirmary, a portion of the part reconstructed a quarter of a century since, was blown down during the gale of Friday night.

During the demolition of the roof of St. Cuthbert's Church, Edinburgh, on Friday, in the course of the operations for rebuilding that edifice, a principal gave way, carrying the scaffolding with it, and inflicting severe injuries on two workmen, named Proctor and Rathlay, in the employ of Mr. White, the contractor.

Intercommunication.

QUESTIONS.

[10681.]—**Qualities of Timber.**—Appreciating Mr. Stevenson's knowledge of timber in general and the interest he takes therein, may I trouble him so far as to ask what are the best ports and brands of fir for building purposes at the present time? I am under the impression that the ports of Dantzic, Memel, and Riga are practically used up, or that very little is shipped therefrom, and that the choice lies between Archangel and Gefle. Is timber for this purpose and for joinery obtainable entirely free from knots and really seasoned? When cut up for rafters, &c., no brands or marks can be traced, and one is then thrown on one's judgment of timber without any clue as to whence it was shipped, &c. Also, noticing his reply on Kauri pine in Building News on Feb. 27th last, are any other N.Z. woods obtainable, and if so, at what price, and in large or small quantities? I refer more particularly to Totara, &c., and woods used more for joinery and cabinet-making. Kauri shrieks whenever a plane is put on it,—J. H. S.

[10682.]—**Railway Curves.**—I should be obliged if some of my fellow-readers would kindly give me some information as to the setting out of railway curves? I wish to set out a curve of five chains radius, and I understand that engineers have a method other than by a centre.—J. C.

[10683.]—**Cement Testing Machine.**—Which is the best make of machine used for testing Portland cement?—Camac.

REPLIES.

[10663.]—**Timber.**—In reply to "J. S." I may say I thought in stating (Dec. 3), "that the red pine (Pinus rubra), as in Hurst's Handbook should read (Pinus resinosa)," I had cleared up the confusion noted by "Woodenhead" (Nov. 4). The confusion exists in Hurst's Handbook, and in "J. S." in defending it—i.e., in following a solitary French botanist, Andre Francois Michaux, who collected the materials for his works when on a visit to America a hundred years ago, and who died in 1803. His "North American Sylva, &c," was translated from the French and published in Paris in 1819. This writer tried to introduce the epithet "rubra"; but it never took root, not even with his own countrymen. Our knowledge of this French name was not general until the above translation appeared in 1819, a date ten years after the appearance of W. Aiton's "Hortus Kewensis," which fixed the epithet "resinosa," which has been adopted by all writers in our language ever since. It is a living name, whereas that of Michaux is a dead name. For proof of this, instance J. C. Loudon in his "Arboretum et Fruiticetum Britannicum," published in 1833, who gives ten references to writers using "Pinus resinosa," one ditto using "P. canadensis," and one (Michaux) using "P. rubra," and Charles S. Sargent Arnold, professor of aboriculture in Harvard College, in his voluminous state "Report on the Forests of North America, Washington, Government Printing Office, 1884," who gives forty references to writers using "P. resinosa" (which he adopts) to three, Michaux included (all French) using "P. rubra." "J. S." (Nov. 27) says: "Hurst follows Michaux's 'North American Sylva,' a work unequalled for accuracy by any produced by recent writers." All I can say is, if he follows him, to the exclusion of all other writers in his mother tongue for his botanical classifications or identifications, he is following an obsolete and confusing guide. "J. S." (Dec. 11) alludes to the Philadelphia edition (1850-51) of Michaux's work, which seems to place him among modern writers and to hold him up in a false light, especially so, as he follows with the remark: "Michaux, who is certainly the best authority on North American trees, and an eminent botanist into the bargain." I have nothing to say against Michaux as a botanist, but he is a bold man who places him before the authorities of this century. Now, as to Mr. Hurst's statement that the American red pine (P. resinosa) is a mere variety of the European, Scotch, or Baltic fir (P. sylvestris). I again say it is no such thing: it is a distinct species, it is not even a doubtful variety. Hurst's assertion is wholly unsupported by evidence. "J. S." says it all depends upon the term "species." What he implies is to widen the meaning of "species" to that of "genus"—i.e., suppress the classification of "species," and simply call one fir tree a "variety" of another. This arrangement is too absurd to follow: it is nothing short of upsetting the science or classification of botany. A species is a distinct type, one from which varieties may be produced by seed, the progeny of which invariably go back to the parent form. The red pine of America can never be a variety of the Scotch fir—until its seeds produce plants resembling the Scotch fir, a thing that is impossible in nature. The red pine has, I grant, much in common with the Scotch fir—firstly, from the fact that it is a conifer, and secondly, from its being in the same section—viz, leaves generally two in a sheath; but it is widely separate in the divisions of this section, inasmuch as the P. sylvestris has cones the scales of which are without prickles, the opposite being the case with P. resinosa; this difference is fixed, hence they are distinct species. As to the grain of the Pinus sylvestris being finer than that of the red pine, "J. S." quotes Michaux, alluding to the red pine, "when wrought as exhibiting a fine compact grain." With all deference to his authority, this is not my experience, who have been practically acquainted with the two woods for over thirty years; nor is it the experience of the above great American authority, Charles S. Sargent, who says of the red pine, "wood light, not strong; hard, rather coarse-grained." There has been a great mistake committed in Hurst's Handbook in holding up the red pine as a superior wood to the Baltic fir—"Grain finer, shrinks and warps less in seasoning, contains less sap, and very free from knots." I question whether "J. S.," or any other defender of the Handbook, can support this statement by any reference or authority. I look upon it as a wild assertion emanating from the writer's ignorance of the subject he had in hand. I gave, I think, sufficient proof of this (Dec. 4th) in comparing the breaking weights, the tensile strengths, and the crushing weights on cubes; but if more is wanted, compare the values on this market of red pine with the red or yellow deal of the Baltic. The assorted qualities of the latter stand at £16, £12 15s., and £9 10s., average £12 15s.; whereas the best shipments of red pine, unassorted, stand at £10 5s. per 165c.ft. I stand by my statement (Dec. 4) that the red pine is a soft, mild, undurable wood, of no special value in the trade, and I am not to be moved from my position that Michaux may have said to the contrary a hundred years ago. It is, no doubt, employed for the decks of vessels, and so is Quebec yellow pine (P. strobus), the softest and mildest pine in the world, each of which are immeasurably inferior to the Baltic fir deck planking shipped, equally as long as the red pine (40ft.) and equally as clean, from Dantzic. Mr. Laslett was, as "J. S." believes, a timber inspector in one of H.M. dockyards, and knew something about timber. He was "timber inspector to the Admiralty." He speaks favourably of the red pine, but he does not, as I have before noted, do this to the disparagement of Baltic red or yellow fir or deal (P. sylvestris). His opinion, as proved by his experimental tables, is that it is vastly inferior. I do not think "J. S." is conferring any favour upon "Sappy" in referring him, for the classification of woods, to such an old authority as Michaux. It is an operation akin to putting back the clock, for three out of the five instances "J. S." gives (Dec. 11) are botanically or commercially wrong. The following is the correct forms of the five species there enumerated:—

Commercial Name of Wood.	Popu'ar Names of living Trees.	Botanical Names.
Red pine.....	The resinous pine, red pine, or "Norway pine," of Canada.....	Pinus resinosa.
Red or yellow fir or deal..	The wood pine, Scotch pine, or Scotch fir	Pinus sylvestris.
Pitch pine. or Georgia pitch-pine.	The Southern pine, yellow pine, pitch pine, long leaved pine, or broom pine	Pinus australis.
Not imported into England ...	The rigid pine, pitch pine, Virginian pine, sap pine, or black pine	Pinus rigida.
White pine, yellow pine, or Quebec pine	White pine or Weymouth pine	Pinus strobus.

N.B.—The Pinus rigida, being called the "pitch pine," means that it bears this name in the district where it is grown, a district where the Pinus australis is not a feature. —William Stevenson, Queen's Dock, Hull, Dec. 14.

[10672.]—**Salisbury Cathedral.**—The groins and ribs of vaulting are of stone, but the filling-in is of chalk and stone, over which is laid a coat of mortar and rubble, apparently ground together and poured on hot to consolidate the whole into one mass. Squinches are thrown across angles of tower to carry the spire, and are strengthened with iron cramps. The walls of spire diminish gradually within, till, meeting with upright of the inside at the height of 20ft., they are reduced to 6in., which is the thickness of the stone to the summit. The ornamental shafts were not generally introduced till the building had taken its bearings, their places being left for them, and being afterwards fixed in a socket with lead and fastened to pillars by brass bands.—E. C. Finch.

[10677.]—**Testing Mortar.**—Take ½lb. of the mortar, crush it fine and mix well. Take of this 100 grains, and treat it with hydrochloric acid. When the effervescence ceases, wash out the sediment and filter it. Then wash the residue on the filter paper with distilled water. If the filter paper be dried, and the residue weighed, this will be the amount of sand in 100 grains of the mortar.—J. W. Bradley.

[10678.]—**Surveying.**—"A. W.'s" question as to whether, "when measuring a field with a very big fall" you "take the actual surface, or the horizontal, as in a map," is so very naïve that it would be doing him a good service to advise him to study some good book on the subject—say "Practical Surveying," by G. W. Usill (Crosby Lockwood and Son), price 7s. 6d.—C. C. S.

A receiving order has been made in the case of C. W. Ward and Co., of the Minories, City, builders and contractors.

Messrs. Archibald Smith and Stevens are supplying to the University College at Nottingham, for the use of the students, a set of hydraulic machinery, comprising one of their "Reliance" lifts, a set of high-pressure pumps, and an accumulator. The latter will also supply water for an hydraulic testing machine. The same firm have had the passenger-lifts at the Grand Hotel, Eastbourne, placed in their hands for overhaul, and, in one case, partial reconstruction. A new pumping-engine and hydraulic accumulator form part of the new scheme. A similar set of hydraulic-power machinery, together with two "Reliance" passenger-lifts, are also in hand for the York-street Property Company, Manchester, the lifts being of the same construction as that just erected by the same makers at Lloyd's House, Manchester. "Reliance" passenger-lifts are also in progress for five separate buildings on the sea-front at Brighton, for Warneford Hospital, Leamington; and in London for: Talbot House, Arundel-street; Geo. Newnes and Co., Limited; New Travellers' Club; St. George's Club; St. Ermin's Mansions; Ashley-gardens (sixth machine ordered); Continental Gas Association; Royal South London Ophthalmic Hospital; Hereford-mansions; Compton House; and six for the Imperial Institute, with other lifts, pumping-engines, and accumulators. A large hydraulic balance-lift is in course of erection under Stevens and Major's patent, at the offices of the North British and Mercantile Assurance Association.

Legal.

SOLE ARBITRATORS.

A very important and practical point as to the appointment of a sole arbitrator under the Arbitration Act, 1889, has just been decided by the Court of Appeal in a way distinctly favourable to arbitration generally as the best method of settling disputes. The case in question is that of "Eyre v. Corporation of Leicester" (*Times*, 8th Dec.), which has been through several courts. The plaintiff was a contractor, and he had been employed by the defendant corporation to construct a main sewer. The contract contained a clause providing for the reference of disputes to the arbitration of an arbitrator to be appointed. A dispute having arisen after the completion of the work, the plaintiff called upon the defendants to appoint an arbitrator under the contract. They refused, on the ground that the matter was not one for arbitration. The plaintiff then sent the defendants a notice calling upon them to concur with him in the appointment of a sole arbitrator to act in accordance with the clause in the contract, stating that in default he should apply to the Court to appoint an arbitrator under the Arbitration Act, 1889. They did refuse. Plaintiff applied to a Master, and then to a Judge at Chambers, but failed to get an order; but on applying to a Divisional Court, they sent the case back to the Master to say whether there should be an arbitrator or not. Now the defendants brought the case before the Court of Appeal, where they failed even more completely, for that Court held that under the Act the Court must appoint an arbitrator, and, therefore, that all the Master had to do was to say who should be that arbitrator, and thus the case was sent back to him for that purpose only. The statute, by section 5, gives the Court power to appoint an arbitrator after notice by either party to the other. "Where a submission provides that the reference shall be to a single arbitrator, and all the parties do not, after differences have arisen, concur in the appointment of an arbitrator." Both the Divisional Courts and the Court of Appeal agreed in holding that the clause in the contract amounted to an agreement to refer all disputes to a single arbitrator. Therefore the plaintiff had a right to give the notice under the Act. Then came the question as to the power and duty of the Court. The Act said the Court "may" appoint an arbitrator, and the Divisional Court regarded this as giving a discretion. But the Master of the Rolls held that it here meant "must," and he stated emphatically that when the parties had agreed to refer disputes to arbitration, and such disputes had arisen, and one party refused to concur in appointing a single arbitrator, "it would be monstrous if the Court could, by refusing to appoint, force the parties to go to law." The Master at Chambers, therefore, as representing the Court, has, under section 5 of the Arbitration Act, 1889, no discretion in this matter, and his duty merely consists in deciding who shall be the single arbitrator to be chosen. Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

J. T. L.—New Building.—Projection.—1. The alteration proposed would not amount to a "new building"; but it might have such a projection from the building line as would require the consent of the Local Board. 2. Subject to covenants in lease or in a conveyance, the owner could build out the window as proposed upon his own ground.

Town Council.—Building.—No; such an account having been settled and closed, the claim could not be reopened again, except upon the ground of fraud, or some clear mistake of facts.

Rollo.—Hoarding.—Basement.—As to an erection on his own land, unless it substantially interferes with B.'s light and air, there is no remedy. There is no "right of sight" or prospect in law, and merely blocking a view is no ground of action. As to the other question, there is no legal way of compelling A. to fall in with B.'s plans for a basement.

A. C. T.—Skylight.—It is hardly possible for such a skylight as is here described to acquire an easement over the adjoining land. But if it could do so from its sloping position, there is no way of preventing it but by running up a wall or a hoarding at any time before the expiration of 20 years from the opening of the light, or by getting the adjoinlng owner to sign an agreement for its use at a nominal rent.

LEGAL INTELLIGENCE.

In re John Reed, of Plymouth.—John Reed, until recently a builder, carrying on business at Plymouth, and now manager for Reed, Blight, and Ccompany, contractors, Plymouth, came up for his discharge at the Stonehouse Bankruptcy Court on the 9th inst. His Honour, Judge Edge, having ascertained that another three or four months must elapse before the contracts were completed, adjourned the application until June next year, the opposing solicitor having leave to examine any further witnesses he might like in the mean time, but leaving on him also the responsibility as to costs if it should be found that these and previous examinations were unnecessary.

Claim for Loss of Light.—Holt v. Sinclair.—At the Liverpool Assizes on Saturday, before Mr. Justice Collins and a special jury, Charles Holt, "Rolighed," Hoylake, brought an action against Alexander Sinclair to recover £500 damages for obstruction of the light to his house. The plaintiff had paid £2,625 for his house and adjuncts, and also spent several hundred pounds on decorations, &c. In February last the defendant commenced to build a cottage opposite, with the result that the hall of the plaintiff's house, which was formerly light and cheerful, was now dark and gloomy. The value of the house was now reduced by about £400. The skilled evidence called for the plaintiff showed that the house had been deprived of 30 per cent. of its light. The letting value had been decreased £20 per annum. In order to recover the light, certain structural alterations, at a cost of £237, would have to be made, while there would be extra expenses incurred by the plaintiff during alterations. The defendant, while denying there had been any damage, paid £20 into court. Before the evidence for the defence was reached the jury intimated that they had heard sufficient of the case. They returned a verdict for the defendant, and his lordship gave judgment with costs. Mr. Bigham, Q.C., for defendant, said his client would make the plaintiff a present of the £20 paid into court.

In re G. and J. Clipsham.—A meeting of the creditors of Henry Clipsham and John Clipsham, trading at Norwell, Notts, as Henry Clipsham, and as G. and J. Clipsham, builders, was held on Friday at the offices of Mr. H. R. Thorpe, Official Receiver, Nottingham. The statement of affairs showed that the gross liabilities amounted to £1,981 3s. 1d., of which £1,832 6s. 11d. is expected to rank for dividend. The assets are estimated at £463 16s. 1d., leaving a deficiency of £1,368 10s. 10d. The Official Receiver's observations were: "The debtors, who have been adjudicated bankrupts on their own petition, state that they commenced business in 1883, under the name of Henry Clipsham and G. and J. Clipsham. The debtors have several building contracts on hand, which are in an incomplete state. The debtors gave, as reasons for their insolvency, that they were 'under capitaled, and also the expenses of actions brought against them for recovery of accounts.' The debtors' books are in a most incomplete state. The debtor Henry Clipsham has no separate assets. John Clipsham estimates that his estate will yield a small surplus to the joint estate. The debtors have clearly carried on business long after they were insolvent." In reply to the Official Receiver, the debtor, John Clipsham, admitted that he made a false statement to the manager of a Newark Branch Bank in order to induce him to continue his account. The Official Receiver said that was a matter which would have to be fully gone into at the public examination. They must admire John Clipsham's candour, whatever they might think of his conduct. A trustee and committee of inspection were appointed.

Appointment of Arbitrator.—Eyre v. Corporation of Leicester.—In the Court of Appeal last week, before the Master of the Rolls and Lords Justices Lopes and Kay, this appeal was heard from the decision of a Divisional Court (the Lord Chief Justice and Mr. Justice Wright). The plaintiff was a contractor, and had been employed by the defendants to construct a main sewer. The contract was made in October, 1888, and contained a provision for the reference of disputes to arbitration, and spoke of the award to be made by the "arbitrator or umpire to be appointed" in accordance with the condition. A dispute having arisen after the completion of the work, the plaintiff called upon the defendants to appoint an arbitrator. They denied that the case was one for arbitration, and refused. He then sent them a notice to concur with him in the appointment of a sole arbitrator. The defendants refused to comply, and the plaintiff accordingly applied at Chambers for an order appointing an arbitrator. His application was refused by the Master and the Judge, but was granted by the Divisional Court. The defendants appealed. Mr. Arthur Toller, for them, contended that the notice to concur in appointing an arbitrator was wrongly given. Further, this was not a case in which the Court should exercise its discretion and appoint an arbitrator. The Court dismissed the appeal, but varied the order of the Divisional Court. The Master of the Rolls said that he agreed with the Divisional Court that there was here an agreement to submit any disputes to the arbitration of a single arbitrator. A dispute had arisen, for it was admitted that part of the plaintiff's claim was within the arbitration clause in the contract. The objection that the notice which the plaintiff had given was wrongly given, was too fine and too technical, and could not be countenanced. When the parties had agreed to submit disputes to arbitration, and such disputes had arisen, and one of the parties had refused to concur in appointing an arbitrator, it would be monstrous if the Court could, by refusing to appoint, force the parties to go to law. He disagreed, therefore, with the Divisional Court, who had sent the matter back to the Master to decide whether there should be an arbitrator or not. All that the Master could do would be to say who the arbitrator should be. The order would, therefore, be varied in that respect. Lords Justices Lopes and Kay concurred.

WATER SUPPLY AND SANITARY MATTERS.

Maldon Sewerage. — At a meeting of the Sanitary Institute on Wednesday week in the Parkes Museum, Mr. Baldwin Latham in the chair, a paper was read by Mr. R. F. Grantham, on the sewerage of Maldon, Essex, with some observations on the recent practice in sewer ventilation. Maldon has a population of 5,500 inhabitants, occupying about 1,250 houses, of which a thousand have been connected with the new sewers. The separate system has been adopted except as regards gullies at the backs of houses through which a good deal of rain water finds its way into the sewers. In the ventilation the line followed has been to have as many openings as practicable, and an increase in the number of upcast shafts, with a view to their preventing stagnation of air in the sewers. The general adoption of this system also to house drains was advocated, and the author suggested that future investigations should be conducted with the object of amalgamating the two systems of pipe shafts, doing away with siphon traps in house drains outside the houses. In the discussion which followed Dr. Parkes, Mr. de Courcy Meade, Mr. Walker, of Croydon, and Mr. Rogers Field were the principal speakers.

Snodland.—The Mid-Kent Water Company is about to extend its works, building a new low-level service reservoir, and laying new mains in Halling, Snodland, and Birling. The engineer, Mr. Arthur F. Bowker, estimates the cost of the new works at £7,500. Contracts are now being made for a considerable part, and the remainder will be proceeded with when further capital is obtained.

CHIPS.

The new board schools, Grimsby, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and vertical inlet brackets, the same being supplied by Mr. E. H. Shorland, of Manchester.

The works committee of the Hull corporation have adopted a report in which they express dissatisfaction with the work of the borough engineer's department, though not casting the slightest reflection upon the integrity of the borough engineer. They propose to take measures for the reorganisation of the department, and with that object they conclude that it should consist of the following officers, at the salaries stated:—Borough engineer, £750 per annum; assistant ditto, £350; chief engineering assistant, £200; second ditto, £125; third ditto, £120; fourth ditto, £60; chief architectural ditto, £150; second ditto, £100; chief clerk, £110; clerk, £40; clerk, £40; clerk, £20; total, £2,065.

Amongst the special gifts to the new church of St. Andrew, Yeadon, is a stained-glass window from the studio of Messrs. Powell Brothers, of Park-square, Leeds. The window illustrates the Conversion of Maximilla, the wife of the proconsul Ægeus, to Christianity.

The annual output of Portland cement in Europe exceeds 20,000,000 tons, of which 8,300,000 are produced in England, about the same quantity in Germany, 1,800,000 in France, 900,000 in Russia, and 800,000 in Belgium. The production of the United States is estimated at about 3,000,000 tons per annum.

The four side chancel windows of St. John's Church, Bradford, have now been filled with stained glass by Mrs. Light, who some time since gave the large east window to the same church. The new window, together with the east window, illustrate the history of Our Lord from His Resurrection to His Ascension. The whole of this work has been done by Messrs. Powell Brothers, of Park-square, Leeds.

Our Office Table.

Mr. T. Henry Bartlett is very dissatisfied with the operations of the Building Act Committee of the London County Council, an untrained, overworked, and constantly-changing body. He suggests that if the Metropolitan Building Act is to be altered as Mr. Ritchie proposes, this Building Act Committee should be abolished altogether; and as a substitute he suggests that a Board consisting of eight experts, all in practice, should be appointed to be nominated, two by the Local Government Board or the Board of Trade; two by the Royal Institute of British Architects [why not one of these by the Society of Architects?], two by the Institute of Surveyors, and two by the Institute of Builders. Three of such Board should sit three times a week to hear and determine on applications, for which a uniform charge of, say, 15s. might be made. In the event of either party being dissatisfied with the decision arrived at, the questions in dispute should be referred to a Board of Experts, consisting of not less than five (members of the chosen eight), the decision of a majority of whom shall be final and conclusive. He also recommends that district surveyors should be forbidden to practise privately, and should be paid by fixed salary. If these changes were made, he thinks confidence would be created, applications would be disposed of quickly, and there would be uniformity of practice within the Metropolitan area.

Within less than three months of the death of his wife, Alderman George Manwaring, J.P., of Brighton, succumbed last week to influenza, after only a few days' illness. As late as the 3rd inst. he had attended a meeting of the Town Council, looking full of vigour and robust health, but on leaving the council chamber he took a chill, which speedily developed into influenza. Inflammation of the lungs supervened, and he died on Wednesday at his residence, 6, Albany Villas, Hove. Alderman Manwaring, who had some years ago retired from his business as a builder, entered the Town Council in 1872, sitting for the West Ward, which he well represented until his death. Possessing great force of character and shrewdness, and capacity for public affairs, he soon came to the front rank in the council, and there were few of the more important works in which the council have engaged for many years past in which the deceased did not take a prominent share, either as a supporter or as an opponent. In 1889-90 he served the borough as mayor. Outside the work of the council, he took a good deal of interest in building societies, and in the management of the Brighton Grammar School and the School of Science and Art. At the time of his death he was engaged in the preparation of a scheme for adapting the latter institution for the purposes of technical education, so as to widen its capacities for usefulness.

Convened by the Hull District Council for the National Registration of Plumbers, a meeting for the distribution of prizes and certificates to the successful students was held on Wednesday week at the Mechanics' Institute in that town. Mr. W. R. E. Coles, clerk of the Plumbers' Company, attended as the representative of the court, and explained in the course of the proceedings the action the company were taking with the object of promoting a Bill in Parliament to make registration compulsory. The following motion was subsequently carried:—"That this meeting of master and operative plumbers, sanitary authorities, architects, and others of Hull and district desire to record its opinion that the time has now arrived when it is essential to the protection and preservation of the public health that the system of registration of plumbers which has been established by the Worshipful Company of Plumbers with the co-operation of various local representatives of the plumbers' craft, and the sanitary authorities, should receive the statutory powers which are necessary to secure the efficiency of the system."

At the "Luckie Horseshoe" Art Studios, at Exeter, last Saturday evening, a very happy time was spent by employers and employed. It was the 25th anniversary of Mr. Harry Hems going first to Exeter, and his staff—to the number of about 80—in accordance with a long-continued annual custom, had supper with him, followed by a very pleasant season, whereat the

fumes from punch and tobacco-pipe bowls added considerably to the enjoyability of the occasion. The Misses Hems proved expert musicians on piano and violin, and the singing of Miss Flo Jennings quite "brought down the house." Mr. Frank Dyer, as the senior craftsman, and twenty-two years with the firm, proposed the healths of Mr. Harry Hems and his sons, and of Mrs. Hems and family, which was accorded musical honours, and Messrs. Hems suitably responded. General harmony followed, and when the hour of midnight sounded from the neighbouring cathedral tower, the art workers joined hands and sang "Auld Lang Syne." This done, the party presently broke up, and another milestone in the record of Mr. Hems's happy life was left in the rear.

The *Railway Review* (U.S.A.) describes a novel method of laying foundations in swampy soil, recently employed by an American engineer. The building to be supported was a low wooden one, which it was proposed to use for the storage of machinery. Casks were set in holes in the ground along the line of posts, and were filled to the depth of about 1ft. with iron turnings. The posts were placed in the casks, which were then filled with iron turnings compactly rammed in place. A solution of salt and water was slowly poured over the turnings, under the action of which they solidified into a hard mass. The heat of the oxidation of the iron was so great that the posts were charred. This also served to act as a preservative, and to that extent the iron turnings are probably superior to concrete under similar conditions.

The Scottish Clerks' Association opened a London branch last year at the Scottish Corporation Buildings, Crane-court, Fleet-street, E.C. Its objects are: To supply firms with competent and trustworthy clerks, secure situations for members, grant weekly allowances to members in case of sickness or unemployment, provide medical attendance and medicine, grant allowances to relatives in cases of death, and to provide an agreeable and welcome entrance to members coming from the provinces to London, or from one city to another. On Friday last the opening concert of this association took place at its head-quarters, when Mr. Alex. Ritchie, L.C.C., hon. member (Messrs. Steven Bros.), presided. Misses L. Duncan, L. K. Jackson, J. Amis, L. Lauterbach, and Dr. Hope Grant, Dr. L. Grant, Messrs. Chapny, Harden, Lilly, and Duncan contributed to a very enjoyable entertainment. The association has paid £1,913 in allowances, and out of a membership of 1,370, few are unemployed at one time.

The Sanitary Committee of the Leeds County Council have resolved to take steps to secure a site, about twenty acres in extent, upon which to erect an hospital for infectious diseases.

New wine stores, in Paradise-place, Cardiff, are being erected from plans prepared by Mr. Charles C. Jones, architect, Cardiff.

Cotes Heath Church, Staffs, was reopened on the 10th inst. after enlargement and repair. The roof has been made sound, the windows throughout have been reglazed with tinted Cathedral glass, the floors relaid with tiles, the seating improved, and a new heating apparatus of hot water on the low-pressure system provided. The church has also been extended eastwards by the erection of a new sanctuary, 18ft. by 15ft., in warm red sandstone. The works have cost about £500. The architect was Mr. C. Lynam, of Stoke-on-Trent, and the contractors were Messrs. J. Ward and Sons, of Uttoxeter.

A churchyard cross has lately been erected to the memory of the late Vicar of Upton Bishop, Ross, Prebendary Havergal, D.D., a brother of the well-known writer, Miss Frances Ridley Havergal. The lower portion consists of three octagonal steps, the bottom one being 6ft. 6in. across. On the top of the third step is fixed the base of the shaft, a square block about 2ft. by 2ft., having chamfers, bringing the top up to an octagon. On the east side of the base an inscription is cut in. On the west a small niche is cut after the old examples. The tapering octagonal shaft is surmounted with a foliated cross in the Early English style, the latter being a reproduction of the former churchyard cross, fragments of which were found many years ago in the walls of the church by Dr. Havergal. The height from the base to the top of the cross is about 12ft. The whole is worked out of blue Forest of Dean stones, and has been executed by Mr. Robert Clarke, of Hereford.

MEETINGS FOR THE ENSUING WEEK.

Tuesday.—Glasgow Architectural Association. "Electric Lighting," by Mr. Cook. 8 p.m.
Liverpool Architectural Society.—"Egypt as a Home of Early Art," Part II. by Rev. F. F. Grensted.

CHIPS.

The Vicar of Worksop is making an appeal for funds to restore the 14th-century ancient gate-house of Worksop Abbey Church. The cost is estimated at £2,700.

The ratepayers of Birmingham, by a majority of 7 to 1, have voted in favour of the resolution proposed at the recent town's meeting, authorising the town council to promote a Bill next session for carrying out a scheme of water supply from Mid-Wales.

The autumn exhibition of pictures in the Walker Art Gallery, at Liverpool, closed on Saturday, when the total sales amounted to £7,327 9s. 6d., and further transactions are still pending. From a pecuniary point of view the exhibition of 1891 will be remembered as the most successful one that the Liverpool Corporation have yet held, the next successful being that held in 1884, when all the principal artistic societies in the country were represented.

During the heavy storm which prevailed in Crewe and district on Thursday night, the chimney-stack of a house in Edleston-road, Crewe, occupied by the borough surveyor, Mr. G. Eaton-Shore, was blown down and went through the roof, falling on to the children's bed, which fortunately was unoccupied.

Mr. S. J. Smith, C.E., Local Government Board inspector, accompanied by Mr. Walker, engineer, held an inquiry on Friday at the office of the Chepstow Urban Sanitary Authority, that body having applied for power to borrow £5,100 for the purpose of draining the town.

The Chelsea Board of Guardians have adjourned, till their meeting next Wednesday, consideration of a scheme for enlarging the workhouse infirmary by a new block, to be erected at the corner of Sydney and Cale-streets, providing accommodation for 35 nurses and three officials. The present nurses' apartments are to be added to the men's wards.

At the Camden School of Art, Bartholomew-road, Camden-road, on Saturday night, Sir R. Temple, M.P., distributed 228 Government awards, won by students of that school, of which Mr. Francis Black is the head master. These awards included two Queen's prizes, gained by Mr. W. S. Thomas, 34 third, and 11 second-grade prizes.

The congregation of Hanham Tabernacle have supplied their chapel with a new organ, built by Mr. W. G. Vowles, of St. James's-square, Bristol, at a cost of £200.

The town council of Gravesend discussed at their last meeting the points whether, in the competition for new municipal offices and markets to be built at a cost of £5,000, a premium of fifty guineas should be offered for the best design, and whether a professional assessor should be appointed. After a long discussion the voting was found equal for and against, whereupon consideration of the question was adjourned for a month.

The restoration of Rochester Cathedral has been proceeding for many years in a piecemeal manner, and the Dean and Chapter are now about to appeal to the public for funds to complete it, their project including the replacement of the present incongruous tower, built in 1826 from designs by Cottingham, by a spire.

Mr. P. H. Calderon's "Renunciation of St. Elizabeth," the sensation of the last Academy show, has been lent by the Chantrey Trustees to the Leeds Corporation, and the picture will form the leading feature of the Spring Fine Art Exhibition in that town.

The Manchester Academy of Fine Arts, which was first instituted in 1859, has been reconstituted, and, with a new code of rules, has now been registered as a specially authorised society under the Friendly Societies Act of 1875.

An inquiry was held at the Local Board Office, Sutton, Surrey, on Thursday, the 10th inst., by a Local Government Board inspector, into the application of the Local Board for power to borrow the sum of £4,000 for the purpose of sewerage. There was no opposition.

The parish church of Horsell, which has recently undergone restoration, has been still further improved by the addition of an organ, which has been erected by Messrs. J. W. Walker and Sons, of London, at a total cost, including the case, of £720.

The bronze equestrian statue of the late Field-Marshal Lord Strathnairn, will be erected at Knightsbridge, at the junction of the Knightsbridge and Brompton roads. Mr. E. Onslow Ford, A.R.A., has been intrusted with the commission.

Trade News.

WAGES MOVEMENTS.

Aberdeen.—The strike of plumbers, which has been going on for the past six weeks, has now been terminated by the Aberdeen Masters' Association having agreed to grant the demand of ½d. extra per hour on the present rate of wages, the increase to take effect immediately.—The Aberdeen carpenters and joiners, at their annual meeting on Saturday night, decided to ask an increase of wages in March next.

Bath.—A meeting of the late employés of Messrs. Harris, cabinet-makers, was held on Friday evening in the Foresters' Hall, Bath-street. The men came out on strike a week or two ago, and they met to consider the situation and discuss the principle of productive co-operation. The men, it is said, intend to adopt those principles and start manufacturing furniture on co-operative lines.

Cardiff.—Notice has been given by the men employed in the Cardiff building trade to terminate their contracts in May next. They demand an advance of wages, and in some cases a reduction of working hours also. About 18 months since they received a rise of wages generally. The master builders will, it is believed, resist the demand, and a strike on a large scale will follow.

Edinburgh and Leith.—The following are the working rules and regulations for the house carpenters and joiners of Edinburgh and Leith approved of by the Board of Conciliation, consisting of seven employers and seven operatives:—1. For competent workmen the standard rate of wages to be 7½d. per hour, and to be paid weekly. 2. The regular working hours to be 51 per week—i.e., 9 hours per day for five days, and 6 hours on Saturdays, except as after provided for. Work to begin at 6, 6.30, or 7 a.m., and to cease at 5 p.m., and 1 p.m. on Saturdays. During winter months the hours to be as follows, viz.:—From November 4 to November 18, 8½ hours, Saturdays 5 hours; from November 18 to December 2, 8 hours, Saturdays 5 hours; from December 2 to January 6, 7½ hours, Saturdays 5 hours; from January 6 to January 20, 8 hours, Saturdays 5 hours; from January 20 to Feburary 10, 8½ hours, Saturdays 5 hours. All time, in addition to the foregoing, to be paid for at the rate of time and quarter up to 10 o'clock p.m., and after that hour double rate of pay to be allowed; but these extra rates are only to take effect after a week's work has been wrought, except in the case of men taken on during the week. Wages to be paid at the regular time of ceasing work, or sufficient time allowed to travel to workshop for these. 3. Within the municipal boundaries of Edinburgh and Leith, men to reach their work and travel from the same in their own time. If not over four miles beyond the boundaries, 6d. per day to be allowed, or travelling time to and from these; but if over four miles, to be allowed 4s. per week, and railway fares when sent to and from the job. When men are taken on for or at a country job, this rule does not apply. 4. After 30 hours' work with an employer, men to be allowed one hour to put their tools in order; and after 51 hours, two hours for that purpose. 5. Employers to provide means for workmen warming their meals at outside jobs and in workshops, and to find someone to attend to the same. Also to make provision for the safety of tools. 6. No piece or task-work to be wrought by workmen, and no sub-letting unless sub-contractor supplies plant and material. No materials to be carried for employer, except in working hours. The above rules and regulations to come into force on the 1st day of January, 1892. In name of Conciliation Board.—Walter Kirkwood, president; Andrew Kiddie, joint-secretary; George Laidlaw, vice-president; George Wilson, joint-secretary.

Holloway's Ointment and Pills are the best, cheapest, and the most popular remedies at all seasons, and under all circumstances they may be used with safety and with the certainty of doing good. Eruptions, rashes, and all descriptions of skin diseases, sores, ulcerations, and burns are benefited and ultimately cured by these healing, soothing, and purifying medicaments.

BILLS OF QUANTITIES & PLANS.

T. Pettitt and Co. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. Pettitt and Co., Lithographers, 23, Frith-street, Soho, London, W. Established 50 years.

DOULTING FREESTONE.

THE CHELYNCH STONE—The Stone from these Quarries is known as the "Weather Beds," and is of a very crystalline nature, and undoubtedly one of the most durable Stones in England.

THE BRAMBLEDITCH STONE is of the same crystalline nature as the Chelynch Stone, but finer in texture and more suitable for fine moulded work.

Prices, and every information given, on application to CHARLES TRASK and SONS, Doulting, Shepton Mallet, Somerset. London Agent:—Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender: it adds to the value of the information.

BRANDON, DURHAM.—For house, shop, and cottage at Meadowfield, for Mrs. Johnson. Mr. H. T. Gradon, Durham, architect:—
White, J., Shieldfield, Newcastle-on Tyne* £342 0 0
* Accepted. Four tenders received.

BEDMINSTER, BRISTOL.—For the construction of a culvert and other works to prevent flooding from the Malago river at Bedminster, for the Floods Committee of the Bristol city council:—
Durnford and Son (accepted) ... £18,000 0 0
[Lowest of five tenders received.]

BURNLEY.—For erection of warehouse and alterations to settling tanks, for the Burnley Paper Works Co., Ltd. Mr. J. W. Bradley, Leicester, civil engineer, who also supplied the quantities:—
Byrom, J., Woolfold, Bury.
(Accepted for the whole of the works required.)

CHELTENHAM.—For the erection of an abattoir for the town council:—
Malvern, C., and Son (accepted) ... £1,645 0 0

CHESHAM.—For new shop front and alterations at premises in High-street, Chesham, for Mr. J. Mayo. Mr. G. H. Green, Chesham, architect and surveyor:—
Mead, A., Chesham (accepted) ... £129 0 0

CHESHAM.—For two houses and factory, Bellingdon-road and Higham-road, Chesham, for Messrs. G. Hawes and Son, brush manufacturers, Chesham. Mr. G. H. Green, Chesham, architect:—
Darvell, F., Chesham (accepted) ... £1,538 0 0

CHESHAM.—For house, Stanley-avenue estate, Chesham, for Mr. H. G Webb. Mr. G. H. Green, Chesham, architect:—
Darvell, F., Chesham (accepted) ... £487 0 0

EVESHAM.—For the reseating and partial restoration of St. Lawrence Church:—
Espley and Co. (accepted as revised) £1,037 7 1

FRINTON-ON-SEA, ESSEX.—For the erection of a private house, for Mrs. G. Storey, of Stoke Newington, London, N. Mr. W. G. Gillingham, Frinton-on-Sea, architect:—

Gladwell, H.	£794 0 0
Dupont, F.	575 0 0
Day, W.	470 0 0
Potts, M.	469 10 0
Allen, J. C., Clacton-on-Sea* ...	465 0 0

* Accepted.

HYTHE, KENT.—For the laying of a drain in Park-road, for the town council:—

Perrin	£1,775 0 0
Street	1,687 10 7
Richardson	1,500 0 0
Lanlidge	1,280 0 0
Toler	1,230 0 0
Rackham	1,189 0 0
Jeal (accepted)	1,098 0 0
Wheeler	1,077 0 0
Mesham	1,053 16 0

HAMPSTEAD.—For building the Hampstead Synagogue. Mr. Delissa Joseph, F.R.I.B.A., architect:—
Allen, J., and Sons, Palmerston Works, Kilburn (accepted) £9,162 10s. 0d.

KINGSWEAR, DEVON.—For the erection of a Swiss chalet at Kingswear. Messrs. E. Appleton and Son, architects:—
Pack, S., Torquay (accepted).

LEEDS.—For doubling the size of the water reservoir at Moortown, for the Leeds town council:—
Gould and Stevenson, Hunslet, Leeds (accepted) about £4,000.

LONDON.—For alterations and dilapidations at No. 6, The Crescent. Minories, E., for Mr. J. Weil. Messrs. Bushell and Crosier, 1, Finsbury-circus, E.C., architects and surveyors:—
Layton, and Son, Hackney (accepted).
(Lowest of three tenders received.)

LONDON.—For alterations at the Sugar Loaf, Great Queen-street. Mr. H. W. Budd, 76, Vincent-square, S.W., architect:—

Lamble	£1,275 0 0
Prestige and Co.	1,258 0 0
Masters	1,227 0 0
Charteris	1,197 0 0
Martin, Wells, and Co. (accepted)	1,070 0 0

LONDON.—For erecting new loading stage and constructing basement under same at Rolls Buildings, Fetter-lane, E.C., for the London Parcels Delivery Company, Limited. Mr. H. Poston, F.S.I., 39, Lombard-street, E.C., architect. Quantities supplied:—

Mowlem and Co.	£1,845 0 0
Morter, J.	1,838 0 0
Nightingale, B. E	1,770 0 0
French, W. E., and Co.	1,679 0 0
Rider, T., and Son	1,535 0 0
Woodward and Co.	1,515 0 0
Patrick, M., and Son	1,482 0 0
Colls and Sons	1,439 0 0
Shurmur, W. (accepted)	1,395 0 0

LONDON.—For building stables, St. Alban's-place N., for Mr. Aldridge. Mr. E. J. Harrison, 70 and 72, Chancery-lane, W.C., architect:—

Andrew, T.	£163 0 0
Ward and Lamble	127 0 0
Houghton, E., and Son	118 0 0

LONDON.—For alterations and improvements at the Eight Bells Tavern, Ironmonger-row, Old-street, E.C. Mr. F. G. Grierson, 9, Old Jewry Chambers, Cheapside, E.C., architect:—
Tunbridge, W. A., Peckham (accepted).
Pewterer's Work:—Davis and Sons (accepted).

FRIDAY, DECEMBER 25, 1891.

ARCHITECTS' SPECIFICATIONS.

IN these days of excessive competition there is a danger of specifying systems and appliances which have a good name, but are not well adapted to the purpose we intend to put them. There is even a risk that, in the desire to introduce novel materials and inventions, we neglect to avail ourselves of older and more judicious methods. The pushing architect likes to make himself *en courant* with the existing state of building progress and the market; but his knowledge is of necessity mainly derived from descriptive catalogues and prospectuses. A large number of heating appliances is brought to his notice, and the question with him is which of them he ought to select or to recommend to the notice of his client. His knowledge of heating arrangements may be limited. He does not understand well the principles of a good heater, or the particular points that ought to be observed in fitting up. He is in actual need of information upon the subject independently of the trade; but where can he go for it? The question of art enters. That which is least unsightly is a consideration; but, for all that, the very ugliest may be the most efficient. To specify that which is most advertised is not always a reliable course. Testimonials and Press notices may with more safety be regarded, because they give some notion of the advantages to be derived from certain systems, and point out the principle. In selecting any system for warming buildings—by hot water, for instance—the principle of circulation of water has to be remembered. As every engineer is aware, the water in pipes parts with its heat by radiation and conduction, and circulation takes place by the water in the descending pipe being colder, and therefore heavier, than the water in the boiler; consequently the colder the water is in the descending pipe relatively to that on the boiler, the more rapid will be the circulation. Upon this principle the system of arranging the pipes has to be determined—that is, to insure greater motive-power the descending pipe must be placed so that the water has to travel a longer distance before it descends, a principle shown clearly by Hood in his treatise on Warming Buildings. The kinds of apparatus for heating buildings by low-pressure are numerous; yet the architect ought to be able to make up his mind as to the best for his particular purpose, how many and what kind of boiler and radiator are necessary, the size and arrangement of the horizontal service pipes, if beneath ceiling or below floor-boards (the former being the most desirable, as saving cutting of joists), the cold supply cistern and its position. These are matters which are left to manufacturing engineers for specifications and estimates in many instances, no doubt with advantage when a good firm is selected, but with certain disadvantage when competing firms are invited to undertake the work in their own way, and to offer tenders. In this case the desirability of deciding on the system, the boilers, the kind of radiators and fittings is very obvious. How much money has been wasted on inefficient or imperfectly executed systems of heating; perhaps owing to the want of properly covering the flow-pipes of mains where they have to convey heat to a great distance, to prevent loss of heat by radiation; perhaps, owing to want of stop cocks and air-vents to the coils, and to the fact that these are not of a good type. In buildings of several floors warmed on this system, good results are obtained by connecting the radiator to the return-pipe. In this branch of our subject we may refer to the question so frequently put in our pages, as to the best plan for warming rooms by heated air. The very excellent results obtained by the warm-air generating Manchester grate, made by E. H. Shorland, by which warm-air flues are carried up the chimney-breast on each side of the smoke-flue, and have inlets for warm air below the ceiling, are not so generally adopted as the value of the system entitles it to be. The principle, also, of heating the air in the hall of a house has been neglected.

Professionalism has not been favourable to independent opinions on these and other matters; it rather contents itself with recommending appliances or new systems in specifying certain goods without personal examination of their absolute merits or defects. We certainly need in these directions more of the artist craftsman, more personal inquiry into and knowledge of what are the best and most appropriate warming, sanitary, and ventilating appliances; which floors are the most desirable; which bricks and terracotta goods are the most durable and artistic; which fireproof floors and partitions give the best results, and are the most economical; what joinery should be used; and what fittings and sanitary fixtures possess the qualities that are most necessary. The fact is, an architect is too much disposed to leave all these questions to specialists and manufacturers, and if he specifies the name of the article or the maker he imagines he has fulfilled his duty. This notion no doubt springs naturally from the threefold division of an architect's function, that he may be either a scientist or constructor, a man of business or an artist, and that construction and art are two distinct things, and are separable, though, as Mr. Reginald T. Blomfield and Mr. Jackson said the other day at the Association, it is absolutely impossible to separate construction from art. Both must go hand in hand. An architect must know, as the latter gentleman has said, how to construct artistically. Nowadays a great deal of the artistic merit of a design is centred in the manufactures and materials which are supplied, and which often lie outside the architect's business. To bring these fittings and details again under his control is the object he should aim at. A modern building is largely composed of ready-made fittings, and an architect cannot construct artistically unless he can influence the design of these things. He can only do so by making himself a master of the difficulties of manufacture, and the principles to be kept in view. But does he? No; these matters are left to the owner or to the taste of the manufacturer, so that all the art of the architect is confined to the general design or elevations. If we consider that the external architecture of a building is mainly composed of floors, walls, and ceilings, joinery, and fittings, the manufacturer must be credited with a very considerable share in the artistic merit of a modern mansion or club-house, hotel or church; such things as mosaic or parquet floors, oak or walnut dadoes, wall and ceiling fabrics and decorations, in addition to fittings—which term comprises almost everything from a door-handle to a firegrate. Artistic construction is not possible if we allow the engineer to decide the position of girders and columns, the form of heating and ventilating apparatus; the electric engineer the design of electroliers, the parquet manufacturer the pattern of a floor, the modeller or plasterer the decoration of a ceiling. Separation between business and art will naturally continue to widen under these conditions. Those who are conscientiously striving for artistic construction are men who design details and put themselves in contact with each building trade. Let us take two or three of these. Brick and terracotta work has made great advances in manufacture. The Doulton, the Ruabon, and one or two others show a decided movement towards an architectural treatment of the material, mainly the effect of a few leading architects, such as Mr. Waterhouse, Mr. Norman Shaw, Messrs. George and Peto, who have shown the art capabilities of manufacture. They design in the chosen material instead of merely specifying. In woodwork and decorative joinery, the system of allowing every contractor to interpret a general specification is repugnant to a proper conception of design. The architect who desires the work to be a credit to himself draws out each detail; he visits the workshop, and gives his own personal instructions; his specification is minute and descriptive, referring to details, and not a mere empty injunction—the "whole to be executed according to the architect's approval." High-class joinery, mouldings, parquetry, and fittings are executed by several well-known firms, to whose hands the architect may implicitly leave the most specific instruction. It is needless to refer to wood-block flooring, parquetry, ecclesiastical fittings and furniture produced by firms well known to our readers, to show that construction and art can be realised if the artist and workman are within touch. Even in metalwork the stock pattern has been raised in its character; and if we look at the catalogues of beautifully-printed chromolithos, we shall find that tiles have an artistic manufacture with some leading firms.

The only means left to the profession to impress their art upon manufacture is the specification. He can select a certain make or a particular pattern. Does he always exercise this prerogative? Is it not bartered away in some cases to reduce expenditure, to be set against extras, or to be left to the taste and whim of the owner? The condemnation of manufactured goods recoils upon the specifier, for he, by these practices, encourages cheapness and bad design. By choosing inferior articles he gives his sanction to the manufacture of ill-designed productions and inefficient workmanship. The weakness of the modern specification is that it merely certifies the name of particular goods; it is seldom even descriptive, rarely instructive to the manufacturer or contractor. Design and workmanship are left to him, the consequence of which is a practical surrender of the architect's intentions. But he has the control if he cares to use it. The specification is the chief instrument. To describe accurately the object, to specify those things which are not shown in the details, should be the aim. The fault is in making the specification a list of provisions, instead of a document of directions to the workman or manufacturer. But this is the ordinary custom. A decided improvement would be made if the ever-recurring "To provide" were to be substituted by the more instructive injunction, How to execute.

NONCONFORMIST CHURCH BUILDING.*

By James Cubitt.

Chapter III. (*continued*).

5.—WARMING.

PUBLIC buildings in this country are most commonly warmed either by hot air or by hot water. The latter may be either on the high-pressure or the low-pressure system. Warming by stoves is

* All rights reserved.

generally unequal. There is too much heat near the stove, and too little away from it. Stoves, also, unless they are sunk in the floor, fail to heat the lowest stratum of air, and, consequently, keep people's heads warm and their feet cool. Those forms of hot-air apparatus, also, which allow the heated air to enter the building at only one or two points, have many of the faults of stoves, in addition to some special ones of their own. They divide the building into a torrid and a frigid zone, neither of them well adapted for human occupation. They burn large quantities of fuel in proportion to the result attained, and though the cost of the apparatus in its unfixed state may seem but small, the expense of the brickwork required to set and inclose it is often large.

The great point to be arrived at on any system is to warm every part of the interior equally; and to do this is not so easy as it seems. Unequal heating is the principal, though not the only, cause of draughts, since the air from the cooler parts of the building is sure to be drawn towards the warmer parts. By its coldness it condenses the warmer air, and so forms a partial vacuum, and into this vacuum it rushes. Everybody knows the unpleasant draught which issues from cupboards and similar inclosures in rooms where there is a fire. A similar draught, on a much larger scale, is sure to proceed from imperfectly-warmed recesses opening into a church, no matter whether they are used as organ-chambers, transepts, chancels, or anything else. And if, on the other hand, such recesses are overheated, draughts will set from the main area of the church in their direction. End galleries are often a source of draught, especially if they are nearly unoccupied, and if they contain, as sometimes happens, a large proportion of window-surface. The warm air passes along near the ceiling of the nave, cools itself against the glass at the end, and descends nearly to the gallery floor after doing so. It is then sucked back towards the nave by the condensation its coldness produces, and falls over the front of the gallery like an invisible cataract. But though it is invisible, its limits can easily be traced. The whole circulation of the air in a building may be made clear to the eye by sending up small balloons of gold-beater's skin inflated with ordinary coal-gas, and weighted so as to have very little tendency to rise.

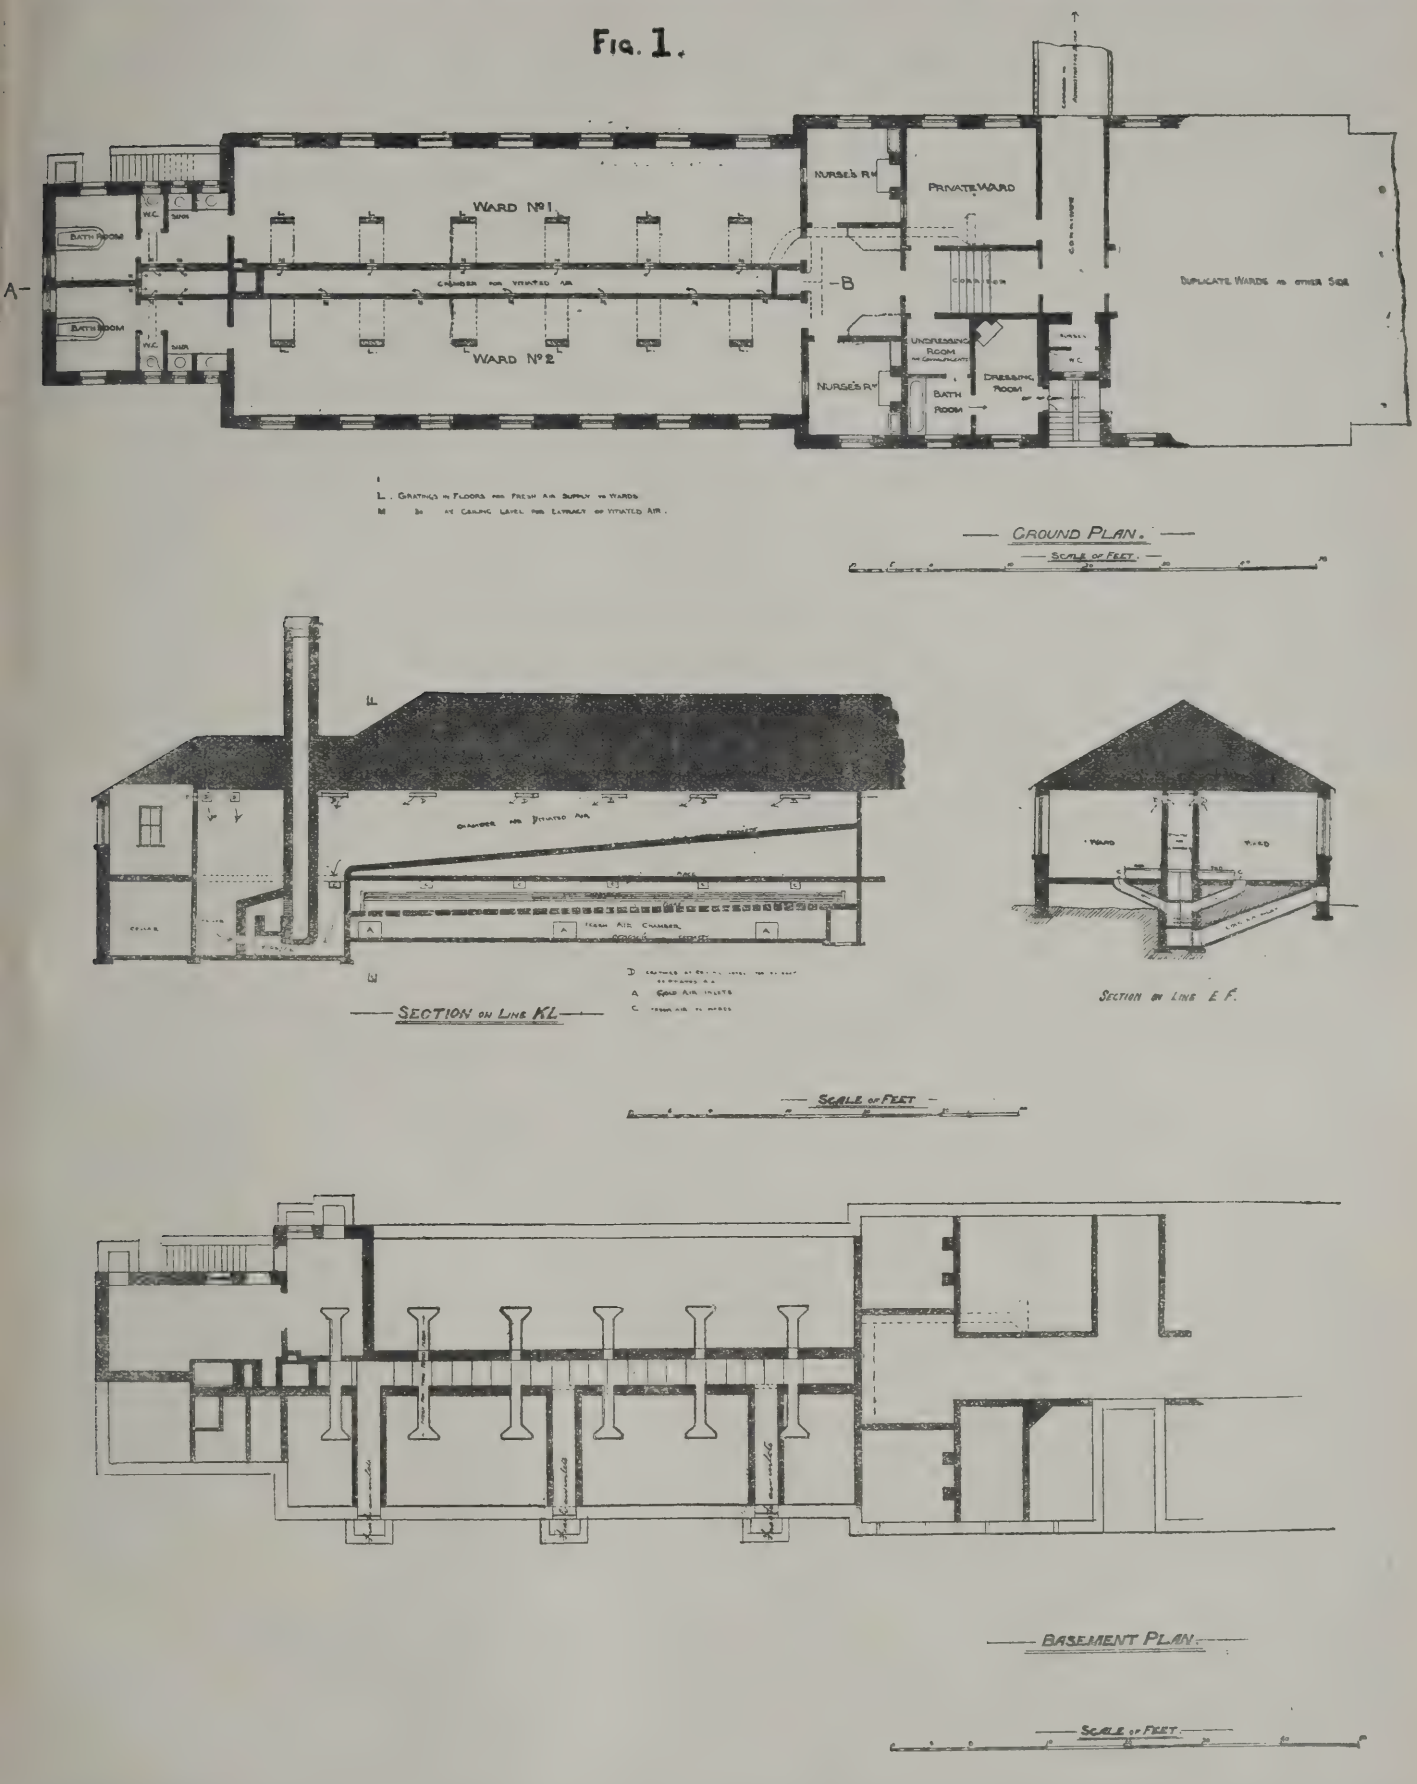
This last case is an example of draughts caused, partly by the natural coldness of an imperfectly warmed recess opening into the church, and partly by the actual cooling of the warm air against a window. And what happens with a gallery window, happens, more or less, with all windows. The warm air touches the glass, cools, and comes down on the heads of people below. Draughts of this sort are generally set down, at first, to imperfect fitting of casements, or the neglect to cement the glazing properly to the stonework; and such causes as these, where they exist, should, of course, be removed. But the draughts that are occasioned by any direct blow-in from the outside, are seldom very serious, and are always easily cured.

A downpour of cold air from the roof or ceiling is very unpleasant, and unless proper precautions are taken, not very uncommon. The heated air rises and rests against these parts of the building, then condenses against them, and comes down. And if the coolest part of the area—the part with fewest heating-pipes or hot-air inlets—happens to be just below the highest part of the ceiling, the downpour is likely to be more rapid and annoying. The cooled air, in such a case, will be sucked forcibly towards the warmest parts of the building, whether they are its sides, its ends, or some of the recesses which open into it; and without any leakage or direct blow-down, this constant fall of relatively cold air may become a serious calamity. It does not need that the descending air should be actually cold. If it is thus in rapid motion, say at the rate of 5ft. or more per second, it will have all the chilling effects that are most undesirable, even though it may be only a very few degrees below the general temperature of the building.

These are the first dangers that need to be guarded against in warming a building—draughts from ceilings, draughts from windows, draughts from galleries, and draughts from recesses. And it must not be supposed that, to get rid of them, we only need a sufficiently powerful heating apparatus. On the contrary, it is chiefly the heating of the building which sets such draughts in motion. Go into the most draughty church when it is unwarmed and unoccupied, and the draughts, unless they are caused by an actual blow-in of the outer air, are hardly perceptible. Set the heating apparatus at work, and the draughts come into action directly. A circulation of air begins, and if this circulation is too rapid, it becomes a serious evil.

To prevent those cold currents which are caused by the chilling of the air against the window-glass, there are two or three expedients. The use of double glass will greatly lessen them. On the other hand, this entails some loss of light, which increases as the glass, not being easily cleaned, grows dirtier with time. Hot-water pipes placed below the windows will counteract the chill more satisfactorily, and hot air in the same position will have a similar effect. Cold draughts from recesses can, of course, be stopped by putting more heating pipes or radiators, or more hot-air outlets in the recesses which produce them. The downpour of air over a gallery front may be checked by a line or lines of hot-water pipe behind the gallery railing or parapet. It is more difficult to deal with draughts from the roof. First of all, it is well to see that the walls have been carried right up, and made good to the roof covering, for beam-filling is one of those easily overlooked items which some foremen think they do their employers service by omitting. When this is ascertained to be perfect, it is desirable to inquire if the system of exit ventilation acts properly. A little leakage in a ventilating trunk, or the leaving open of a door or a valve which ought to be shut, will probably turn the outlet system into an inlet system, and will let in the outer air at the top of the church instead of at the bottom. If neither of these faults exists, any downpour of air from the roof is pretty sure to be the result of its cooling there and descending. The question is: How to keep it from cooling. Hot-water pipes just below the highest part of the ceiling would form an excellent remedy; but, except on the high-pressure or small-pipe system, there are considerable difficulties in the way of getting them there. Hot-air flues carried up from the basement, and opening near the highest point of the interior, are perhaps more manageable. By these or similar methods the cooling of the air against the roof surfaces can be neutralised, and, by means of dampers, the amount of hot air sent up can be regulated according to circumstances.

All systems of warming and ventilation need intelligent management. There is not, and there probably never will be, any self-acting system, which, once put in, will work automatically in all states of wind and weather and outside temperature. The quantity of air which will enter the building by the ventilating inlets is enormously greater on a cold day than on a warm one, and the extent to which these inlets are opened needs to be carefully regulated accordingly. In any system, too, which aims at perfection, what may be termed the draught-destroying section of the heating apparatus should be separated from the section which does the general warming. There is a considerable part of the year, in spring and in autumn, when warming of the building as a whole is not required, though at the same time down-draughts from windows, ceilings, and galleries are apt to be troublesome. What is wanted then is to work this supplementary part of the heating apparatus without working the main part. This implies the keeping of the two parts distinct from the first, if not necessarily the use of two fires and of two boilers. Where the two parts are entirely separate, the high-pressure hot-water system might be conveniently used for the draught-destroying section, and the low-pressure system for the general scheme of heating.



If competing tenders are invited from several heating engineers, the number of degrees to which the internal air must be raised above the external should be definitely stated, so that they may all compete on equal terms. For example, such a clause as the following may be used: "The heating apparatus must be capable of raising the temperature of the air in every part of the church 25° Fahr. above that of the air outside the building, whenever the latter is at or below 40°, and it must do this within eight hours after the fire is lighted, without over-driving the apparatus. The inlet and outlet ventilators are to be closed during the testing, and the building is to be unoccupied by a congregation." And it should be clearly made known, too, that the lowest tender will not necessarily be accepted. It is a very short-sighted policy to adopt an ineffective system of heating because it looks cheap. The heating contractor, it is true, may be bound in his contract to alter the apparatus at his own cost until it produces the specified temperature. But this means, first of all, delay and discomfort to the congregation during the period—usually long—which is required to convince the contractor that the apparatus is not powerful enough. Then it means more discomfort while pipes are being taken up and relaid. It means the cutting about of the building in unforeseen and objectionable ways, and, finally, the production of the specified temperatures by the adding of coils and other awkward appendages, placed, it may be, at the very points where no additional heat was ever wanted.

In comparing the cost of various heating schemes, it is important to ascertain what quantity of brick trenches and iron gratings each will require. The cost of the trenches is not usually included in the heating engineer's tenders, and this part of the work has to be done by a builder. Where there is much of it, it may form a rather serious addition to what purports, according to the tender, to be the cost of warming a church. With regard to the three principal modes of warming — namely, hot water under low pressure, hot water under high pressure, and hot air—the first is the most durable and satisfactory for the general heating of a building, while the other two may conveniently be used for dealing with draughts and local sources of cold.

A PATENTED FEVER-HOSPITAL PLAN.

In the Building News for the 11th inst. we gave a description of the Bradford Fever Isolation Hospital, erected in the Leeds-road, from the designs of Mr. W. J. Morley, of the firm of Messrs. Morley and Woodhouse, of that town. To-day we publish two plans and a section showing the exact arrangement which constitutes the subject of the patent, and it will be readily seen by these drawings that the main idea consists in the extraction of the foul air, and the destruction of germs or bacteria in it by means of a furnace. All the windows are made tight, and the fresh air is let in by three shafts from

FIG. 1.

the outside, carried under floors and into the lowest compartment of the 3ft. space between the two wards. Above this compartment, and divided from it by flags with open joints in another compartment, are placed the heating pipes, and from this compartment flues are carried into the wards which conduct the fresh air (warmed in cold weather by contact with the heating pipes last named) into the same through gratings in the floor, one being placed at the foot of each bed. Above the compartments above named is an extracting flue made perfectly air-tight, and into this flue openings are made at the ceiling level of the wards over each bed. A powerful furnace, with honeycomb firebrick divisions, is placed in the cellar at the end of this flue, and this furnace draws the foul air out of the wards, and it passes through the furnace and out into the open air by a large chimney. Thus all vitiated air from both wards, w.c.'s, bath-rooms, &c. (which are all connected with the flue), passes through a furnace which is heated up to at least 800°, and therefore is more than sufficient to destroy all obnoxious germs. The working of the scheme has been properly tested by the anemometer, and it has been found that at least 10,000c.ft. per hour per patient can be passed through the wards and out through the furnace, and that at the same time in cold weather a temperature of at least 60° can still be maintained in the building.

The system is intended mainly for smallpox hospitals, and it is in the working out of the idea of doing this that the advice given by Dr. Burdon Sanderson, of Oxford, has been followed.

"BUILDING NEWS" DESIGNING CLUB.

A SMALL CONVALESCENT HOME.

THE first subject for the new session of our Designing Club has proved exceedingly popular with our contributors, if we may judge by the number of designs sent in; and it certainly is a subject for congratulation that so many have taken up the work of the season with so much energy and determination. The following are the conditions which we issued for the competition:—

A.—*A Small Convalescent Home* on a detached site at the foot of a cliff facing the sea. The frontage to be 100ft. long, and measuring 60ft. deep, with a fall from back to front of 5ft. The building is to set back 15ft. from the frontage line. Accommodation to be provided for twenty-four patients, equally divided among the sexes. The day-rooms and dormitories are to overlook the sea, and have open verandahs, reached from a glazed door either immediately out of or adjoining the several rooms. A bath-room, lavatory, cloakroom, and two w.c.'s in each of the two departments, and also a nurse's bedroom commanding the dormitories. The administrative department is to be located in the centre of the block, and is to include a committee-room, a matron's sitting-room, a dining hall entered from both departments, a kitchen, and its usual offices. Separate entrances and staircases to be provided. A small turret for bell and clock to form a feature in the design, which is to be treated in red brick and tile hanging, with tiled roofs.

From the numerous designs submitted, as might be expected, not a few were very nearly equal in merit, and it was not an easy task to determine which plans should be awarded the first places. None, to tell the truth, are quite suitable for erection as they stand. All have faults, and we are far from supposing that the chosen designs are all that could be desired. On the whole, they are the most free from objections, and their merits are conspicuous. "Smilash the Goth" we place first, "Ayrshire" comes second, and "McGinty" ranks third.

Taking the plans first, it will be seen that "Smilash" locates his dining-room in a sort of mezzanine arrangement, half-way, as it were, between the two floors, with windows at the ends of the hall, and a china store and serving-room, with lift, at the north end, where there is a private staircase from the kitchen. The entrance halls to the two wings are the weakest part of the plan; and the cross passage, with its borrowed light from the kitchen, seems hardly necessary in so small an institution, particularly with the committee-room and the matron's room doors placed as they are. The effect is crowded and cramped. The same area could be made with a very little trouble so much more spacious in arrangement. The staircases are well lighted, and the dayrooms are spacious and square. This form for the two dormitories is not quite the best for arranging the beds to the best advantage, and the toes of the patient who sleeps in the alcove would be uncomfortably near the nose of the occupant of the first bed in the central row. The nurses' rooms are nicely managed. In architectural treatment "Smilash" is too ambitious in detail. The inverted arches and the lower verandah front are samples of the kind of thing we take objection to. A little more simplicity another time would be an advantage. The perspective is too long drawn out for correct proportion. A little more height to the chimneys would improve the elevation, and under a cliff the increased draught would be needed. The drawings are well grouped on the sheet, and are business-like. "Ayrshire" is more simple, and in this respect we like his design better. He places his dining hall to the rear, and makes it a less important room. The male and female entrances look awkward with the bend in the passage-way, and it is not quite clear how the wall to the angle of the dormitories is carried over the staircase. Of course it could be done; but it is not good planning to create such contrivances. The landing would be none too light, and the bath-rooms are none too large, if big enough, which we question. The dormitories are nicer in shape than in the first plan, but they require open fireplaces. The man's room is conveniently disconnected from the maids' rooms. A block plan and perspective are missing from this sheet of drawings. We took this into account, however, in making our choice, so that no injustice really has been done to "McGinty," who comes next. The last named, who is one of the best contributors to the work of our Club, ranks third, and we like his plan in many ways better than either of the first two; but in elevation his building looks too much like a seaside villa, while in its arrangement the waste of space in passages and on three staircases, combined with their awkwardness, relatively prevents a better position being taken. We quite expect "McGinty" to score higher another time. "Hilarius," in his plan, has the dormitories running north and south, with windows east and west. The dining-room is contrived at the rear, with a central and dark corridor. Much space seems lost by the third staircase, and there is a want of care in the minor parts of the planning. The committee-room seems needlessly large, and the stores are pinched and badly placed. The elevation would work out fairly well; but it is not particularly clever, and, saving the merit of simplicity, calls for no comment. "Symbol" sends a design of curious conceit, original but ugly in elevation, with a plan of some merit. The matron's room divides the two sexes; but behind her room are the staircases, and these would be very dark. The dormitories are capitally arranged, with all the beds against walls, and not in front of windows. "Pen" has a good plan, save that he, too, spoils it by dark halls, over which, by the way, he wastes more space than necessary. The dining-hall is situated between the two wings on the ground floor, but as the matron is located beyond the kitchen to the left, and the committee-room is in directly the other position to the right, we cannot describe the arrangement as perfect as it should be. The dormitories are good, but the nurses have an associated room in common between the two wards. What "Pen" was thinking about when he carried up the frightfully ugly bell and clock-turret over the bay of the male ward, we cannot think. There is not a good point about it. The verandahs and windows are suitably treated. "Nil Nisi Bonum" overdoes his elevations. Three gables, two tower-like bays at the ends of the façade, and a clock flèche in the middle, besides two gables in the return fronts. All this is crowded and dear, but not really bad in detail. The plan is business-like, but small in parts, and dark decidedly. Dormitories should always have cross ventilation, if possible, and the nurses' bed and sitting-room should not be combined in institutions of this kind. They need a bedroom each, and 12ft. by 10ft. is a roomy size; but 12ft. by 12ft. is not really big enough for a dormitory for three adults, such as this plan provides for both sexes. About 60ft. super. is the required space for each bed in sick cases. "Black Prince" sends a very odd design, having a sort of German high-roofed brick and stone tower in the centre, and verandahs on either side constructed of big vertical timbers, running in one piece from ground to eaves, and with curved strut pieces, making a V-shaped form of the same proportions. This looks very odd in perspective. The plan should have had separate staircases for the two sexes, and so much space should not have been wasted in the main part of the front on a committee-room, surgery, and laboratory. The wide hall is a good feature; but two entrances are desirable in such an institution. The dormitories have no cross ventilation, and the oriel bay window which makes such a grand feature in the centre of the front is really of a very subordinate use on plan in a passage between the two balconies. "Albyn" has rather a good elevation to his design, practical and simple, in a square brick and tile style. His plan is marked by study; but the loss of space on the ground floor under the w.c. and bath-room above is wasteful, crude, and foolish. "Jean" is neat, and deserves praise for ingenuity of plan, for there are many merits in his thin-looking design which leads us to expect much more from him than this, his maiden essay. "Leo" is rough and bold, not to say reckless, in his drawing. We refer chiefly to the perspective done big on the sheet. The plans are neatness itself. The walls are expensively thick inside the building, and the ground-floor rooms are too small. The upper floor is very much better, and the arrangement is not bad. "Cottonopolitan" has caught the thread of our intentions; but has lost the main idea in a labyrinth of passages, bays, bows, angle-set borrowed lights, &c. His main front looks very well; but everything is made much too subservent to it. "An Old Hand" is not so happy with this design as we could wish; but his elevation is far better than his plans. "Q. E. F." merits the same remark, and while his geometrical elevation is very carefully and well drawn, his sketch is rough, blotty, and crude. The day rooms and dormitories are dark and badly planned in the matter of the relative positions of doors, fireplaces, and windows. "Red Brick" is very careful too, but a fancy for "features" carries away a better judgment, and so in the result we have an overdone treatment too full of points for a simple review like ours to describe. "So quaint" we presume is his intention. "Baluster" gives us a sketch-like composition, with a façade carried by a piazza of stone columns and a queer sort of gable in between. The plan lacks study of its parts. "Finem Respice" deserves to be at the end, as his plans came in late. Another time he must be more careful. His plan shows that he knows what he is about, though he wastes money on 14in. internal walls and space on dark lobbies and passages. "J." in a circle is neat and comely, sending a design which would look better in execution, but the plan is poor. The other designs are grouped in the following order of comparative merit, but we cannot pretend to have placed them in absolute order. They vary so that this would be hardly practicable. "Go-bo," "Hales," "Love's Labour?" "Sunset," "Jackey," "Compass Box," "Hut," "Ko-Ko," "Sparrow," "The Idler," "Orient," "East Anglia," "Ilex," "Ivanhoe," "Western," "Plan," "Sphinx," "Pastime," "Unitate Fortior," "Norman," "Jamrach," "Punch," "The Useless One," "Persevere," "Sanitas," "Wasp," "Herbert," "Pendragon," "Sector," "Streona," "Johnny Jones," "Compass" in a circle, "Flute," "Magnet," "Black and White," "Mica," "Filiolus," "G. T. P.," "Nodrah," "Sniktaw," "Graham," "Hardwick," "La Crosse," "Devil's Chimney," "Airedale," "Peterborough," "Ich Dien," "Yorkshire Tradition," "Mars," "La Cigale," "Old Postage Stamp," "Wit," "Faber-niger," "Boreas," "Tempus Fugit," "Leontes," "Westward Ho" (unfinished), "San Juan" (ditto), "Thrift," "Terracotta," and "S. X. X."

SUGGESTIONS FOR THE PRACTICAL EDUCATION OF AN ARCHITECT.*

I STRONGLY advise you not to confine your study to old work; but watch the current architecture of the day, so far as it is worth watching. It has always been the laudable practice of your Association to visit new buildings and works in progress, and you cannot do better than continue that practice in the future. When one does find good modern work, there is something about it more inspiring and stimulating than about old work, however superior the old work may be. You feel that your own case is not hopeless when you see good work done by your friends and contemporaries, who are within your reach, not removed, like the great masters dead and gone, who speak to us only by their works. You there see also the application of novel materials and new ways of using the old, and you find in them suggestions for new design on your own part; and if there be any real life in the work you are studying, it cannot but be enlivening to be brought into contact with real living art in your own day and country. Bearing the same point in mind, let your reading be of a practical kind. Besides books of technical instruction in carpentry, masonry, brickwork, and so on, read such works on architecture as deal with it from the constructional as well as the historical and æsthetic side. There is no better reading of this kind than is to be found in Viollet-le-Duc's great Dictionary; his conclusions are sometimes fantastic, and his judgment prejudiced; but if you read carefully his article on "Construction," which occupies nearly a volume to itself, analysing and making notes as you go on, you will rise from it a wiser man, and will have got a better understanding of the nature and motives of Mediæval architecture than by any other reading I can tell you of. There is nothing comparable to it, unfortunately, in English; and, indeed, considering the mass of printed matter about architecture, it is wonderful how few books there are of any direct use to the student. Encyclopædias, dictionaries, and handbooks there are in plenty; but few of them go really deep into the subject. A work that professes to treat of all known styles,

* By T. G. Jackson, M.A., F.S.A. A paper read before the Architectural Association, Dec. 11, 1891.

ancient and modern, within the boards of an octavo volume or two, cannot be more than superficial. Even Fergusson's books, excellent as they are—capital, as far as they go—are more useful to the amateur than the student. Above all, do not try and make yourselves all at once encyclopædias of architecture. Confine your study at first, and, indeed, to a great extent all your life afterwards, to those styles which practically concern our modern use. Egyptian, Assyrian, Persian, and Indian architecture are interesting studies, and no educated man would like to be entirely ignorant of them; but the knowledge which contents an ordinarily educated man will suffice for you. Dare I say the same of Greek art? I approach the question with some trepidation; but to speak honestly, I should say that it may safely be put on one side by the student, and regarded, even in his riper years, rather as a splendid illustration of what art can achieve under certain conditions, than as having any direct bearing on his own work. With Roman art it is different: as the system of Roman policy permeates our civil constitution, and the roots of Roman speech intertwine themselves with our language, so did Roman architecture, in its progressive transmutations, give birth to all modern European styles, both those of the Middle Ages and those of the Renaissance. Roman art must be studied, though to my thinking—I say it with diffidence, and the consciousness that many of my hearers will disagree with me—it is most interesting when regarded in its parental relation to the styles to which it has given birth, and which will naturally be the main objects of your studies. It is not by reading books and studying illustrations that you will learn practical architecture. Reading about things is very different from seeing them; you will learn more by one visit to an actual building than by pages of description. Accustom yourself from the first to regard your books only as guides to teach you what to look for in real buildings, and follow up any course of reading by going to see for yourselves the things you have been reading about. In the same way, do not think that by drawing in an architect's office you will ever learn how designs will come out in reality, or even that you will thoroughly understand the meaning of your own drawings. Go, if you can, to the building itself; see for yourself how the details work out; how the different parts are constructed, what difficulties they present, and how the workmen surmount them. I have always recommended my pupils at the end of their term to put themselves for a season under a clerk of works, and help him set out the work and direct the workmen. I cannot say they always take my advice; but those who have done so have not failed to benefit by the practical knowledge they gained. Remember that your calling, as I said before, is to design for craftsmen, and this you will not do successfully unless you have a practical knowledge of craftsmanship yourself, which is not to be gained from books or in the office, without resort to the building-sheds, the scaffolding, and the workshop. What can be more absurd than to sit all your days indoors designing things which you never see made? You are safe only on the condition of copying accurately what has been done before, because, knowing nothing practically of the working of materials, you may, if you quit the strict path of precedent, be using your material improperly, wastefully, and at the same time ineffectively. Take, for instance, the very common error into which architects have fallen in their use of marble. You have been used to stone, and when an opportunity occurs of using marble, you think you have only got to go to work in the same way and your work will be as much finer than masonry as marble is finer than stone. You know, indeed, that marble was not treated in this way of old; but you think, perhaps, you can improve on the flat surfaces, the shallow sinkings, and the superficial mouldings of the old men, and do something better and bolder; and so you proceed to work it into the roll mouldings and deep under-cuttings to which you are accustomed in stone. The result, if you have anything of the artist in you, will disappoint yourself. One has seen too often examples of marble spoiled in this way with extravagant waste of labour, and an effect, after all, inferior to that of stone. They have failed because the architect has misused his material, and this most likely because he has never practically studied the way of working it. Had he accustomed himself to watch carvers and masons working marble laboriously with drill and chisel, he would have seen why marble was always treated by the masters of old with shallow sinkings and square returns, without under-cutting, and he would have learned that the plain surface treatment he despised was needed to give due effect to the colour and texture of the material. He might even have risen to the notion that Classic architecture itself, which is largely a marble style, derived its peculiar details from the convenience of the masons who had to work this stubborn material. Take, again, the case of wrought-iron work. You know, from old examples and from drawings, that ironwork can be twisted and hammered into certain forms, and welded together while hot; but you have never seen a weld made, or a scroll beat or hammered into shape. As long as you keep to designs that have been done already you may escape disaster; but if you have the right stuff in you that makes an artist, you will soon grow tired of that, and want to design something original. You make your design, and write your instructions with a light heart—"Weld these together," and so on. As a matter of fact, perhaps the smith cannot weld them, for reasons unknown to you; but he puts the work together in some other way, as like your drawing as he can, and very likely you are satisfied. But the work nevertheless is a sham: you designed it for welding, and the smith has made it look like welding, when it is really nothing of the kind. Now had you gone and seen him with your drawing, and watched him hammering the iron, you would have understood his difficulty at once, and if you were really an artist you would there and then have taken out your pencil and altered your design to suit and express the methods to which the smith was obliged to have recourse. I might go on with examples from all the other trades, how, for instance, the work of carpenters and joiners is often doubled uselessly, and the expense also doubled uselessly, by framing being contrived so as to force the craftsman to do by chisel what with a little management you might just as well have enabled him to do by plane. This would be obvious to you at once if you were familiar with the workshop and saw how tools were used, and how labour might be economised. But time forbids me to dwell longer on this subject; you will easily extend to all branches of construction and design the lesson I have tried to point in the foregoing instances. The sum of the matter is that there is no such thing as successful design without the legitimate use of materials; in this lies the secret of good and economical construction, and of expressive design. Without it you may sit all day in your office inventing fresh designs, but they will one and all be worthless. And the knowledge necessary to enable you to design sensibly, so as to make the best use of the means at your command, is not to be had from books, but from actual study of good work, both ancient and modern, and from actual contact with handicraft and handicraftsmen. I trust, therefore, that your educational scheme, which is now in process of elaboration, will include some mode of bringing your students into the workshop among the workmen, not of one or two only, but of all the trades in their turn which it concerns an architect to deal with in the course of his practice. I believe there would be no difficulty in this, so far as the craftsmen are concerned. Nothing would do more to help their work than to have a body of architects to deal with in the future who knew something practically of the trades for which they made designs and specifications, instead of men who, for want of knowledge, frequently set them unnecessary tasks, and lay upon them unprofitable labour. I would even go further, and say that it would be extremely desirable that every architect should actually learn some handicraft, so as to understand its difficulties and its possibilities; and by learning these in the case of one craft, he would be better able to appreciate them in the case of the others. But, even if you stop short of this, you may, at least, approach yourselves to the handicrafts in the way I have suggested, by shutting your books and flying off to the workshops, and learning how to design in a way that gives the workman no unnecessary trouble, makes the most economical and reasonable use of the materials, and satisfies the canon of art which requires that design shall be based upon construction, and be the outward expression of it. This brings us back to what I said some time ago, that the main thing an architect had to learn was *to construct well, with an artistic motive*. Let us compare this definition with that lately put forth from an autheritative source, and see how they agree. The President of the Royal Institute of British Architects, in his opening address on November 2, defines the ideal architect as "the man who unites the qualities of an artist, a constructor, and a man of business." Against this, so far as it goes, I have not a word to say. The inseparable connection—I do not say between architecture and construction, because architecture includes construction—but between design and construction is the text on which I have been enlarging to-night; if I have said nothing yet about business qualifications, it is not because I undervalue their necessity, but because I have been talking solely of architecture; and business qualifications, though as necessary to an architect as they are to all who mix in the affairs of life, are not architecture, and, moreover, cannot to any very great extent be taught. But the president goes on to say, "It is given to few to excel in all [these three qualifications], though there are many who, possessing a general knowledge of each, are proficient in one or the other. And is one who is distinguished by artistic taste to regard with indifference, or a species of contempt, others who may be less artists and more scientists? Or is one whose genius in construction to look askance at others who are more purely artists?" He does not go on to put a similar question with regard to those whose genius is more for business than for art or construction, whose claims to be considered architects he apparently did not find defensible. Now here I venture, with all respect to the President, to think he is wrong. As Mr. Norman Shaw points out in his letter to the *Times*, "He divides those who practise architecture into three classes; first, those whose proclivities are artistic; second, those whose genius is constructive; and, third, those who, *par excellence*, are men of business. We also make this distinction, and are fully alive to the necessity of good construction; but we think that the men forming the two last divisions, are, *as such*, not architects at all. The scientific constructor already exists in the engineeer, the business man in the surveyor and commission agent." Now, if it is possible to take an engineer or a surveyor, and by endowing him, to use the President's words, with "a general knowledge" of art, thereby to make him an architect, then good-bye to architecture as an art. I have in that case been merely wasting words to-night in trying to explain that architecture is not the result of adding more or less of art to sweeten the bitterness of construction or enliven the dryness of business, but a ruling motive, which must be present from the very beginning, and inspire and govern the construction itself. This view is totally irreconcilable with the officially-pronounced view of the Institute, that a "general knowledge of art" superadded to sound business habits or skill in construction will suffice to make a man an architect. This definition occurs in the course of the President's defence of the system of examinations conducted by the Institute, and imposed as tests on all who seek to become members of that body. And, as our subject to-night is architectural education, it is time to say something on this matter of examination, about which there is, as you know, great difference of opinion, not only between the Institute and outsiders, but even within the Institute itself. Examination is the contribution of the Institute to the cause of architectural education. "We do not teach," they say, "but we examine." Their theory is that the necessity of preparing for examination will direct the student in the course of his studies and give him system in his reading. I hope to show you that so far from these examinations being a help to the education of the beginner, they are, in fact, only a hindrance and distraction. In the first place, they put before him a wrong motive. He learns, not in order to know, but to pass, and he will get no solid good from study pursued with such an object as that. Looking to examination as his goal, he will not—dare not—work in any direction that does not lead that way. He may have a special bias to some particular branch of architecture, and desire for a time to give himself to it exclusively, but we cannot linger; the examination awaits him, and he tears himself away and dilutes his attention to spread it over the whole field of architecture. He may know himself to be ignorant of some other branch of

his subject, and wish to work it out thoroughly and master it, but he knows it will not pay with the examiners, and he is forced to content himself with that superficial knowledge which is all he can hope to master in the time and over so large an area of subjects. The system which was promised him for a guide and help proves only a clog to his progress. Let me quote the admirable remarks of Prof. Aitchison on this subject:—"System is an excellent thing, and if it only means the inclusion of what an architect must know, nothing can be said against it. But a man must take care that system does not prevent him learning anything. I have been through examinations, and when I started to prepare myself I spent several days in laying out a systematic course of study, and I endeavoured to follow it, but I found there were subjects that I could not master in the time set down for them. If I had stuck to this systematic system I should have learned nothing; and what I had to do was to learn the subjects and ignore the system." But, we are told, the examination has the inestimable advantage of enabling the students to test "the extent and accuracy of their knowledge." I believe it does nothing of the kind. On the contrary, it enables them to play off their shallow knowledge, or perhaps that of their crammer—for that worthy has, I hear, already appeared on the scene—against the wits of the examiners. In order to pass, the candidate must answer a certain number of questions on a wide range of subjects. It is a pure chance what he will be asked, and he loads his mind with a general superficial knowledge—a kind of mental dust-shot—which spreads so wide as to be sure of hitting something, though it will not penetrate very deep. This is not the kind of examination that enables the student to test his own knowledge. It is not like the examinations of the pupils by the tutors under whom they have been working during the term, the object of which is to ascertain whether the lessons have been properly understood. It is not like the examinations at the Universities of Oxford and Cambridge, where, again, the subjects are clearly defined, and have been all taught during the collegiate course by the same men who examine. The Institute examinations are totally different, for though it examines, it does not teach, and has no students. But the most fatal deception practised upon the innocence of the student is the pretence that it is an examination in architecture at all as an art. It is an examination of what can be learned from books and drawings, but contains no test that the student has ever carried his knowledge afield and tried it in the actualities of life. Accepting for the moment the President of the Institute's threefold division of architecture into art, construction, and business habits, it is evident that only one of the three can really be brought to the test. You may examine a man in construction, no doubt—that is to say, in construction apart from art, but how are you to examine him in his business qualifications? I acquit the President of including among these the extraneous pursuits which many men follow besides architecture, such as belong to the land surveyor and estate agent, the lawyer, and the speculator in building schemes—a class of pursuits so foreign to architecture that no man who follows the two can hope to succeed in both. I assume him to mean such a faculty for keeping expenditure within bounds, and insuring that his employer gets his money's worth, and of controlling the builder and workmen with tact and good temper, as is necessary if things are to go smoothly and well. But who is to examine the student in that? In the first place, it is a matter of habit which can only be acquired by actual experience, which the young architect can only learn as he goes on, for assuredly no one can teach it him; and in the second place it is largely a matter of natural tact and temperament, which may be improved, but cannot be supplied if it is absent. Still less is it possible to bring his artistic qualifications to the test of examination, if there is any truth in the picture I have to-night attempted to draw of what they should be. You may ask him questions in the history of the art: he may satisfy you as to dates and names, periods and examples; but, as I have already said, he may have all that at his finger's ends, and yet be incapable of architecture. He may be a good antiquary, and yet remain totally devoid of imagination and sense of beauty, without which he can never be an artist. You will never invent any test which you can safely apply to qualifications of this kind; if you try to exercise it you will infallibly fail to keep out those who are unworthy, and probably also shut your door in the face of some heaven-descended genius whose originality you may fail to appreciate. Observe, I entreat you, that this is not a question of examining for a prize, when you compare one design with others and give the reward to the best. That is easy enough and fair enough, and in its prize fund and scholarships the Institute has a grand opportunity for stimulating and distinguishing art students. But we are now considering a totally different kind of examination—a qualifying one—one for excluding or admitting a student, primarily to the ranks of the Institute, and, secondarily, to those of the profession. For though the Institute at present disclaims any ambition to make architecture a close profession under their presidency, still it comes to the same thing, for they aspire to sweep us all into their net, and their dream of the final state of architecture is that every architect shall perforce have passed into the Institute through the gates of examination. The illustrations by which the President tried to defend examination are altogether irrelevant. "Is not life," he seems to say, "one long examination? Do not artists submit to examination when they send their pictures to the Academy? Does not everyone who is employed practically submit to examination by his employer?" and so on. Now all this is really trailing a red-herring across the path. One might as well ask whether it was not by examination that butcher Jones secured my custom instead of butcher Smith. The examination we protest against is a qualifying one, one which you must pass in order to get your bread in a certain calling; and it is obvious that this is not the case with the President's illustrations. Painters who are rejected at the Academy are not debarred from selling their works to anyone who will buy them, and there is nothing in my dealing with Jones which prevents Smith from selling his mutton to other people. I do not say that in theory it is absolutely impossible to construct a system of examination so rigid that every incompetent pretender to architecture shall be excluded. But who is to be trusted to keep the door? How many in a generation would be found worthy to pass it? For instance, if it were tried to-morrow, would all the present members of the Institute be found on the inside of the door, or would a good many be left gnashing their teeth on the outside? Such a system of selection is impossible, and yet anything short of it is a mere imposture and a sham. The majority of candidates are, and must be, mediocrities, and you will have to admit them with their middling gifts, and to suit your standard to their capacities. If you argue that they will at least be no worse for being examined, I reply that they will certainly be no better, and that at all events it would have been something not to have set your seal on them by way of recommending mediocrity to the public. However, examination is now the banner under which the Institute sails, and the next step is to be the extension of this test to the different grades of that society. The President asks why the Fellows are not to enjoy the same blessings as the Associates, and suggests that they too should be required to pass an examination for the higher degree. And so we go on till, if I may be forgiven for trifling with so serious a subject, one may imagine the Presidential chair thrown open to competition in order that its occupant may not be excluded from advantages of examination enjoyed by the inferior members. I have dwelt at some length on this matter of examination, because at the beginning of your new educational system it is all-important that your students should make up their minds what they are trying for; and because, if your schools become mere places for training or cramming architectural students for passing examinations, you are, in my humble opinion, going the safe way to reduce them to uselessness, and to alienate the interest of all who look upon the study of art with different eyes. The note of alarm has already been sounded; when the Institute was considering the question of a grant of money to your schools, one speaker proposed that the grant should be given at the rate of so much a head for every one of your students who passed the Institute examinations. How this was settled I know not; but I do know that the idea that this would be the main motive of your teaching has prevented several architects from aiding you whose advice and experience would have been of infinite service. Believe me, that if you propose to your students such an end as this, you will be putting before them an unworthy motive, and your schools are predestined to barrenness. On the other hand, tell your students that they come here simply to learn to be architects, without any secondary aim; teach them architecture in all its aspects, constructive and utilitarian, but always in conjunction with good design; make them learn a few things at a time thoroughly rather than many things lightly; insist on having a reason for what they do, and hold them back from a fresh step till they have mastered the first; bring them as soon as possible into touch with the craftsmen, and make them craftsmen themselves if you can; let them learn from things rather than from books, enlarging their knowledge by experience of technical methods, which is the readiest way of sowing in their minds the seeds of fresh elements of design; above all, teach them to keep bright by constant use such strains of originality as their nature possesses, and you will make your schools true nurseries of architects; though I think it very likely your students would be plucked in the Institute examination. When I reflect that it is with you, gentlemen, the younger members of our craft, and with those students whom you are now undertaking to train, that the hope of English architecture lies, it seems impossible to overrate the seriousness of the crisis. Your new schools may do much to help our art onwards, or they may aid in stifling it under the dull weight of professionalism. I put before you good and evil, artistic life and artistic slumber; it is for you to make your choice.

FRENCH IMPRESSIONIST PICTURES.

A SMALL but very interesting collection of pictures is on view at Mr. Collie's Rooms, 39B, Old Bond-street, by La Société des Beaux Arts. These comprise works by several great French impressionists, including Degas, Monet, Monticelli, Pissaro, Sisley, Ribot, and others of the same school. To the taste of the ordinary picture-gallery public these works may not be very acceptable, as they are far above that standard of conventional art which the English picture-buyer and critic have have accustomed to regard as excellent. The pictures of Corot and Degas appeal to those only who have not made traditional convention absolute canons, and who can admire the beauty of form and colour apart from those technical qualities which are usually met with in English, Dutch, and other schools of painting. To such Nature, in all her soul-stirring truthfulness, mystery of light and colour, has more poetry and charm than those literal transcripts which seek to reproduce the forms and outlines and colours of objects, as perceived by sense devoid of feeling and emotion. Instance M. Hervier's "Cour de Ferme," a delightful, amber-toned view of a farmyard, is not a mere transcript; it is not a finished picture of all details, but the poetry of form and colour, which the painter has tried to realise for us. Still more so is the very fine luminous landscape by M. Monet, "Effet de Neige," (1) in which the snowstorm effect over a town and meadows is conveyed to the eye. The distant houses, above which stands the church, form the distance of a wide expanse of meadow, covered with flakes of snow, which gleam in the light, and fill the air and sky. The painter has given us the impression of the flickering snow-drift as far painters can, the vivid brightness of atmosphere softening the tones of the distant objects. A broad landscape (4) by Daubigny is another idealised picture; another by Monticelli, described as "Paysage avec Figures," (8) is a beautiful example of this impressionist. It represents a hillside, with groups of girls and children reposing on the grass, the evening sun lighting them up with a warm glow intensified by the shadows. Against the horizon of the hill is a dark figure. Simple in composition, there is a wonderful sense of atmosphere and sunlight; the painter just gives us enough to realise the charming effect of sunshine on an upland of pasture overcast by a cloud. The technique is revealed only by close inspection of the brushwork. The darker tones and colours are subdued and reduced in tone by lights put on over the shadows, producing the effect of atmosphere and sunlight. But we turn with greater admiration to the same painter's

"Souvenir d'Ecosse" (10), a rather irrelevant title, for a landscape composition with groups of female figures. A background of dark hills inclose a party of maidens, who have all the charm and grace of pose and colour of those of Watteau, but with a delicacy of outline and subtlety of tone at once unique. The grace and movement and rhythm of the scene, the delicate modelling of the faces, and the graceful outline of draperies, never prominent, but rather suggestive of ideal beauty, are remarkable in the painter's work. As in all good impressionism, definiteness is lost in pursuit: we mean to say that fresh beauties are revealed at each look. We do not catch all at one glance, but we are constantly discovering some form or face, or some bit of delicate colour in the subtle blendings of the composition. A companion subject, "L'Automne," by the same painter (14), is another idealised landscape, crowded with forms of beautiful figures, brilliant in their draperies. We might imagine the subject to be a masquerade, or one of Watteau's garden parties, but the deeper meaning of the artist appears in the suggestion of autumnal richness of tone and colour. The grouping and subtle decorative harmony of tone are what mainly captivate us. Two small studies by Hervier, "La Bûcheronne" and "La Femme à Charette" (15) are clever; the first, a small figure study of a woman carrying a bundle of wood on her back, with a child by her side. Both are full of spirit and meaning. The works of M. Degas, who sends seven pictures, are deserving of attention. "Après le Bain," a nude study of a female who is seated on the edge of a bed, after a bath, in the act of turning out the lamp, is clever as a figure study, and is in coloured crayon apparently. "Une Danseuse" is a sketch in chalk, and No. 18, "Chevaux de Courses," is a pastel drawing of racehorses, remarkably clever in the drawing and foreshortening of the bodies and limbs; but one of his chief works is his "Chez la Modiste," a girl trying on a hat opposite a mirror, behind which the modiste stands with another hat in hand. The contrast of the figure of the young lady against the golden-toned background is happy, the drawing of the girl's head and her expression are exceedingly clever, and the light and shade well managed. Even more remarkable as a feat of imaginative composition is "La Répétition," a ballet-girl tying her shoe-strings behind one of the wings of a stage, while beyond are seen the dancers under the lights—a wonderful picture, resembling the same artist's work at the New English Art Club. The graceful drawing of the sprightly *figurante*, whose head is bent down facing the spectator, and is adjusting her shoes, encircled by the circumference of her short skirt, makes almost a flower-like form; the foreshortening, and the graceful lines of the figure are dexterously executed. The expanse of stage and the dark shadow of the wing give value to the bright lights of the ballet going on, and both in drawing, light, and colour, this work is very clever. A lady seated near a window (21) is a very effective study of contrast of figure in shadow against the strong light of the window. "Un Café Concert" is a rather clever sketch. Some of these are painted in oil on paper. There is one Corot, a grey-toned view of the village of Flesselles, and another, No. 7, a fine sunset, throwing into relief the darkened landscape, both representive of the late impressionist's work. M. Ribot is represented by two very effective studies of still life (5 and 13), in which the light and shadow are skilfully painted. The small Dutch landscape by M. Hervier (11) is characteristic.

ARCHITECTURE OF THE RENAISSANCE.

THE third part of Messrs. Gotch and Brown's folio of photographs* in illustration of the Renaissance mansions and other buildings in England from 1560 to 1630 has just been issued to subscribers by the publisher, Mr. Batsford. The contents of the present number may be said to be thoroughly representative of the period chosen for illustration, and richness of the work selected is unquestionable when such examples as Kirby Hall, Rushdon Hall, Blickling Hall, and Audley End supply subjects for the camera. The plans, too, where given with the descriptive account of the buildings, greatly enhance the interest and value of the photographs. Kirby Hall, for instance, is shown by John Thorpe's plan from the Soane Museum, and also by a plan recently made from the present ruin. There are several sketches, too, of details in the margin of the letterpress. It seems an oversight on the part of the authors not to give references to the professional journals to illustrations previously given of the buildings here represented. Richardson's "Architectural Remains" and the A.A. Sketch Book are referred to for other illustrations, but the whole series which have appeared, for example, of Kirby Hall in our own pages are not mentioned, notwithstanding that Mr. Langham's drawings (Feb. 25, April 7, and May 12, 1876) of the house which we then gave are perhaps the best that have ever been published of Kirby Hall. Rushton Hall, another Northamptonshire mansion, is the second subject, with two capital photographs and a plate of details, besides a plan. A foot-note refers here to Tom's engraving of "The East Prospect of Rushton" as being issued in 1750, showing also the church and stables. Few people can refer to this old plate, so that it would have added to the value of the note had it been stated that this old view was reproduced in the BUILDING NEWS for Aug. 11, 1882. Readers may now make a note of it for themselves. It would have been better still had Mr. Gotch reproduced the plate itself, with his description, for Winstanley's view is an exceedingly interesting one. Blickling Hall, the famous house of the Hobarts in Norfolk, is illustrated by two capital photographs—one of the entrance front in detail and the other showing the grand staircase. A plan of the house, as it exists now, is given in the letterpress. It may be interesting to note here what the author evidently does not know, as he has not mentioned it in his description, that the ornamental pedimental terminals over the upper windows of the façade in the gables are made of cast iron and coloured like stone. Now, however, the rust has destroyed the pigment, and the red in parts is clearly visible. A sheet of plaster ceilings shows some designs of this character from Rushton, Blickling, and Audley End. The latter building is further represented by only one plate, and that illustrates one of the porches of which Mr. John Evelyn makes mention in his quaint description, saying it is "a mixed fabric 'twixt antiq. and modern, but observable for its being compleately finish'd and without comparison is one of the stateliest palaces of the kingdom." A copy of Thorpe's plan of the house adds great value to the text of the book, and some scraps of detail increase its interest if they do no more than enliven the page. Knole House, Kent, is beautifully represented by two photographs by Mr. Essenhigh Corke, of Sevenoaks, and a well-condensed account of its history accompanies the plates. The grille design and rain-water head drawn in the margin are spiritedly sketched. The apartments illustrated by the camera prints are of the Cartoon Gallery and the Ball-room chimneypiece, giving a large-scale representation of the curious and handsome frieze, divided into bays by grotesques in the shape of brackets. The plate of details of old woodwork, &c., will be useful for those who copy old work and palm it off as specially good and original work of their own. The ceiling of Knole House staircase we have lately seen reproduced in this way. North Mymms, near Hatfield, is a pretty brick house in Hertfordshire, with two ogee-shaped roofed towers; Lilford Hall, Hinchingbrooke Hall, Dingley Hall, Rothwell ruined market-house, and Lyveden New Building are also among the subjects shown in this part, which concludes the first volume.

* Architecture of the Renaissance in England. By J. ALFRED GOTCH, F.S.A., and W. TALBOT BROWN, A.R.I.B.A. Part 3. London: B. T. Batsford, High Holborn.

THE MARENT GULCH VIADUCT.

A FULLY illustrated paper, by George S. Morison, A.Am.Soc.C.E., appears in the September number of the *Transactions* of that body, descriptive of the Marent Gulch Viaduct in Montana on the main line of the Northern Pacific Railroad. In dimensions and general quality it resembles the Portage Viaduct built in 1875, though it represents ten years' advance in iron viaduct construction. The Marent Gulch structure, like that of Portage, replaced a wooden viaduct in alternate spans of 20 and 50ft., and the iron structure in its divisions is made to agree in part with those of the wooden original. It has five spans, each 116ft. 8in. long, and four towers and four girder spans 30ft. long, making a total length of 796ft. 8in. The total height from top of masonry to top of stringer is 201ft. 9in. The two central towers, which are over 190ft. high, have a slight batter. The width at top of each tower is 23ft. 4in., the same length as the panels in the spans. The strains which they were designed were, 1st, the live load; 2nd, the dead load at top and intermediate points; 3rd, the wind pressure on the top and also at intermediate points; 4th, the traction strain due to the pull of the locomotive on the resistance of brakes applied at the top of tower. With a maximum wind pressure and no live load—an inconceivable condition—a small tension is created at the bottom of windward side of tower. Provision is made at base of tower for expansion and contraction, its length being over 31ft. The superstructure is rigidly bolted to the tops of towers excepting at two points, where expansion steel rollers are provided; the central span expansion is compensated by the spring of the lofty towers. Each tower rests on four points only on masonry piers, and is stiffened by diagonal bracing. The spans consist of deck pin-connected trusses, full details of which and the towers are given. The superstructure was manufactured from the author's designs by the Union Bridge Company at Buffalo. The design is simple, the spans are of five panel lengths of diagonal bracing, and the towers are constructed on the same principle, so that the wind pressure is reduced to a minimum by the openness of the structure.

TYPOLOGICAL MUSEUMS.

AT the last ordinary meeting of the Society of Arts, Lieutenant-General Pitt-Rivers, F.R.S., read a paper on typological museums, as exemplified by the Pitt-Rivers Museum at Oxford, and his provincial museum at Farnham, Dorset. He said that the great desideratum of our day was an educational museum, in which the visitors might instruct themselves. For such a museum originals were not necessary. Casts, reproductions, and models were preferable; the proper specimens could be more easily selected; they were infinitely less costly. Museums of casts did not compete with the research museums, in which originals should be stored. Models occupied less room than originals, and could be more easily arranged to exhibit sequence within a limited space. When dates could not be given (as in the case of most prehistoric objects, and many of the arts of savage nations), recourse must be had to the sequence of type, which he termed "typology." By this he meant the study of the growth, varieties, and developments of the several types. General Pitt-Rivers described the method of arrangement in his museum at Oxford, and explained the character of the museum at Farnham. Acting on the principle that a local museum should contain a good historical series of the prevailing manufactures or industry of the locality, he had come to the conclusion that in a rural district, sparsely inhabitated by scattered agricultural villages, and ten miles from every town and railway-station, the chief features of the collection should be agriculture and peasant handicraft. The museum had been formed on a definite system, and had been a great success. It included pottery, costumes, personal ornaments now in use among peasant in Germany, France, Spain, and other nations carvings, tools, &c.; glass and enamels, model of local excavations, models of ancient monuments, implements of all periods, and many agricultural appliances. Within a short distance of the museum he had formed a recreatio ground, where his private band played on Sunda in the summer. During the past year th recreation ground was attended by 16,839 persons, and the museum by 7,000. Whether or not his more ambitious scheme for a typological museum failed to be realised, at any rate, his provincial museum might be claimed to be a success, judging by the constantly-increasing numbers who visited it, and that, too, in a district which, at first sight, appeared very unpromising.

The frescoes which were discovered a few months ago in the Church of Angioli, at Lugano, have now been freed from their covering of plaster. They are pronounced to be finer and older than the famous "Crucifixion" by Bernardo Luini which decorates the centre of the same church.

CORK COURT HOUSE: SELECTED DESIGN.

We published the report of the referee, Mr. Thomas Drew, R.H.A., in this competition in our issue for Oct. 23rd last, and to-day we illustrate the chosen design, the author of which is Mr. W. H. Hill, F.R.I.B.A., architect, of Cork. It will be remembered that the pediment shown in the centre of the composition shows the existing old part which is to be retained. The assessor, writing of this design, says:—"It is an admirable, straightforward plan, well lighted and inextravagant, evidencing complete familiarity with the procedure of Irish law courts, and the convenient provisions to be made for it. The conditions, save cost, are well observed; the Courts are placed next the side, but quieter, streets. This gives some advantages to the rest of the plan. My estimate is £23,300, or, taking away the dome for comparison with other designs, £22,500." We shall shortly illustrate the second premiated design, by Sir T. N. Deane and Son, architects, of Dublin.

TWO VIEWS OF LEVENS, NEAR KENDAL.

The late Mr. John Dando Sedding's posthumous book* on "Garden Craft," just published by Messrs. Kegan Paul and Co., as might be expected from the pen of such a writer, is readable and entertaining from frontispiece to finis, and there is no more interesting page in the volume than the graceful memoir of the author by the Rev. E. F. Russell, with which its pages open. Among our illustrations to-day, by the courtesy of the publishers, we are enabled to present our readers with a reproduction of two of the original drawings figuring to a smaller scale in the book to which we now draw attention. The subject thus chosen represents the celebrated old yew gardens at the manorial hall called Levens, the historic home of the Howards, with its clipped hollies and yews shaped in fantastic forms resembling birds and bottles, dumb waiters and donjons, ovens and judges' wigs. Beaumont, who designed the Hampton Court Gardens, was responsible for these, and his portrait may still be seen at Levens in the house. The gardener's house continues to be called Beaumont Hall. There is some fine tapestry and much rich oak carving in the mansion at Levens. Samson and Hercules support the chimneypiece in the dining-room, while the "four seasons" and five senses are represented by emblematical figures in the same apartment, which cost, they say, over £3,000. The park is a very beautiful one, and is situated some five miles south of Kendal. With these sketches of Levens gardens before us, with memories of Arley, of Brympton, of Wilton (where the Italian garden is one of the most beautiful in England), Montacute, Rockingham, Penshurst, Blickling, Brickwall, near Northiam, Severn End, Berkeley, and Haddon, we can but pause with the writer and bewail our losses. Wolsey's garden at Hampton Court is now effaced, for the design of the existing grounds dates from William III. Nonsuch, near Epsom Racecourse, in Surrey, is a mere memory, like many more. These gardens, the handiwork of the makers of England, bore, or bear, the marks of heroes. They are the relics of the men and women who made our land both fine and famous in the days of the Tudors—big men who thought and did big things, men of splendid genius and stately notions, past masters of the art of life who would drink life to the lees. "The English garden was not born yesterday—the bombastic child of a landscape gardener's receipt. It epitomises a nation's instincts in garden craft; it is the slow result of old affection for, old wonder at, beauty in forms, colours, tones; old enthusiasm for green turf, wild flower, and forest tree. Take it at its best, it records the matured taste of a people of nature-readers, nature-lovers; it is that which experience has proved to be in most accord with the character and climate of the country, and the genius of the race." In the ideal garden of Bacon, and the attitude of his school towards nature, says Sedding, "there is no trace of mawkish sentimentality of the modern 'landscape gardener,' proud of his discoveries, bustling to show how condescending he can be towards nature, how susceptible to a pastoral melancholy," with "codes of taste" where "the lover's walk may have assignation seats, with proper mottoes, urns to faithful lovers, trophies, garlands, &c., by means of art." "To speak generally of the subject, it is with the art of gardening, as with architecture, literature, and music—there is the Mediæval, the Elizabethan, the Jacobean, the Georgian types. Each and all are English, with a difference, with a declared tendency this way or that, which justifies classification, and illustrates the march of things in the changeful modern world. The various types include the Mediæval garden, the square garden, the knots and figures of Elizabethan times, with their occasional use of coloured earths and gravels; the pleach work and intricate borders of James I.; the painted Dutch statues, as at Ham House; the quaint canals, the winding gravel walks, the formal geometrical figures; the quincunx and *étoile* of William and Mary; later on the smooth, bare, and bald gardens of Kent, the photographic copyism of nature, by Capability Brown, the garden-farm of Shenstone, and other phases of the 'landscape style,' which served for the green grave of the old-fashioned English garden." "Levens is probably the least spoiled of any remaining examples; and this, it seems, was designed by a Frenchman, but worked out under the restraining influences of English taste. Garden craft was then no mere craze of a passing fashion, but a serious item in the round of home life. But even yet some may demur that the interest of the antique garden, as we see it, is due to Nature, and not to art agencies. If a garden owed none of its characteristics to its maker, if it had not expressed the mind of its designer, why the essential differences of the garden of this style and of that? Certain it is that along with the girdle of high edge, or wall, has gone that air of inviting mystery and homely reserve that our forefathers loved, and which comprises one of the pleasantest traits of an old English garden." The writer then discants on "landscape gardening," inaugurated by the aid of "the immortal Brown," and Kent, and "moon-struck Shenstone," the poet. Modern gardens meet with much contempt at his hands, "with their flower-beds shaped as crescents, and kidney-beds like flying bats, or bubbling tadpoles, commingled butterflies, stars, and sausages, monograms, and maggots. Better tonic for the over-wrought brain than the soft glamour of the well-swept lawn, the clipt shrubs, the focussed beauty of dotted specimens, the ordered disorder of wriggling paths and sprawling flower-beds of strange device;—better than these is the stir and enthusiasm of Nature's broad estate, the boulder-tossed moor—where nothing breaks the silence of the hills but the song in the air, the tinkle of the sheep-bells, and the murmur of the moorland bee." Such is the strain with which the writer concludes the whole matter, acknowledging, with a delightful inconsistency, that after all nature alone, untrammelled by art, is the most soul-satisfying. His book is full of fresh fancy, and is furnished with an amplitude of apt quotation ably put together, an artistic mixture made with much originality, like most of his many designs. Throughout the same spirit of delight for the art of the past, its inheritance for the present, and possibilities for the future, marked all his aims; but, with a true rough-shod determination of a keen Radical, he seldom lost to view the object of what is called "the main chance." Vigorous to a degree, and enthusiastic beyond control, he handled his subject with promptitude and capability. This book shows even more than this—a true love of the homely and sublime. The practical outcome of the volume is not so clear, and its pages afford no patterns to crib from, though on many a page are trite sayings worthy of quotation. The drawings which serve as illustrations give plans and views of curious suggestions. The samples we now print are among the most attractive.

"Who loves a garden still keeps his Eden."

* Garden Craft, Old and New. By the late John D. Sedding. London: Kegan Paul, Trench, Trübner, and Co., Ltd., Paternoster House, Charing Cross-road. 1891.

BUILDING NEWS DESIGNING CLUB: A SMALL CONVALESCENT HOME.

(See description on page 894.)

HOUSES AT WESTCOMBE PARK.

These houses have been erected for the freeholder from the designs and under the superintendence of Messrs. Florence and Satchell, of 3, Verulam-buildings, Gray's Inn. They are situate within a few minutes' walk of Westcombe Park station on the South-Eastern Railway, and are intended to supply a demand in this rising neighbourhood for family residences, which shall be of attractive appearance and of roomy proportions, and shall also, by economy in planning and general arrangement, be within the reach of occupiers possessing moderate incomes. They are built of red brick with tile hanging, and have Broseley tile roofs. Internally they are fitted with all needful requirements. The builders are Messrs. Balaam Bros., of Shenton-street, Old Kent-road.

PUBLIC BATHS AND WASHHOUSES, HORNSEY ROAD, N.

(These sketches are described on page 919.)

DETACHED VILLA, SNEYD PARK, BRISTOL.

The arrangement and accommodation of the principal floors of this house are clearly shown by the small-scale plans; in addition to which are cellars in the basment, and four bedroom sand linen-closet on the second floor. The site is at the junction of two roads facing the well known downs, the materials being native stone quarried on the site with Bath-stone dressings. The builders are Messrs. Walters and Son, and our illustration is reproduced from a drawing by the architect, Mr. H. Dare Bryan, of 38, College-green, Bristol.

BALDACHINO FROM THE CHURCH OF THE HOLY REDEEMER, CLERKENWELL.

The Baldachino over the altar at the above church, like the building itself, is thoroughly Classical, and, therefore, rather foreign to the genius of the late J. D. Sedding, who was the architect. Although interesting as emanating from him, it lacks that intense originality and "go" which usually characterised his work. Whether the return, as in this instance, to the Italian style, so largely adopted by the Romish Church, is likely to gain ground remains to be seen. We are inclined to doubt that it will. It seems, however, that the Gothic Revival, associated with the Ecclesiological movement, has not brought forth all that was expected of it. Perhaps it is that all architectural style, after once it has reached its zenith at the hands of men of real genius, is doomed to suffer degradation and ultimate decay at the hands of a host of mere copyists. These, possessing no taste or feeling to guide them, vulgarise a style otherwise beautiful by reproducing it in ignoble forms, and become mere manufacturers of a spiritless art. Our sketch is made from a photograph by Mr. Knights, of Brixton.

The schoolboard for Stoke-on-Trent have adopted plans prepared by their architect, Mr. E. C. Scrivener, for the enlargement of the Fenton, Bagnall, and Harpfield schools.

The new wing of the High Wycombe and Beaconsfield Memorial Cottage Hospital was opened on Saturday by Mr. Coningsby Disraeli. The wing has been erected with the surplus money of the fund raised for the purpose of a national memorial to the late Earl.

THE BUILDING NEWS DIRECTORY.

At the request of many advertisers it has been determined to commence with 1892 the weekly publication of a BUILDING NEWS DIRECTORY, to which Architects may easily refer when in search of the makers and vendors of Architectural and Building Specialities.

The large Advertiser is, of course, to a considerable extent independent of such help. By his judicious iteration of the merits of his specialities he effectually impresses the mind of the constant reader with his claims to attention. But he will find it to his interest to avail himself of our new help to publicity; and besides, there are hundreds of Manufacturers who never advertise in the ordinary way, or who, if they do so, only advertise one or a few of the articles they make and supply, and who yet essentially need *constantly to remind Architects of their existence.*

It may be urged that the Trade Directories and Price Books to a certain degree supply this want; but when it is remembered how limited, comparatively, is their circulation, and how swamped the comparatively few that are wanted are for the most part amongst hundreds of thousands of other names and addresses in which Architects have no interest, and among which they are seldom likely to search for what they require, it will be seen at once how advantageous in a Journal like THE BUILDING NEWS will be the introduction of the feature we contemplate.

We propose, therefore, to devote space *in the body of the paper, immediately preceding and following the Illustrations*, and not among advertisements, or on the inside pages of the outer sheet, to a carefully-arranged *Directory of Makers and Vendors of Architectural Specialities and Builders' Appliances*, under generic and suggestive heads which will naturally suggest themselves to Architects and others in search of Advertisers' addresses.

It will be evident, of course, that many Manufacturers will desire to have more than one entry in the list, because they supply more than one speciality. For the majority possibly one entry will be ample, and that we undertake to make and to repeat weekly in every edition for the sum of ONE POUND PER ANNUM, payable strictly in advance, and expiring on the 31st of December in each year. We cannot undertake to charge for parts of years in connection with this matter, so that entries should at once be forwarded, accompanied by the necessary subscription, that they may appear in our NEW YEAR'S DOUBLE NUMBER, on January 1, and throughout the whole of 1892.

Clients who may desire to have more than one entry under different heads can do so to any extent they please by payment of *One Pound each* for every additional entry.

All payments *must be made in advance*, as this feature is not introduced as a remunerative one to the Publisher in itself, and the small charge made will barely defray expenses, and will not allow of booking. Name and address must not exceed one line.

The following firms have already entered their names up to Dec. 18. We have more in hand, but cannot guarantee to include any that do not reach us *at once*—at any rate, in our New Year's Number:—

ARCHITECTURAL DESIGNERS—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

ARCHITECTURAL PHOTOGRAPHERS—
Bedford, Lemere, and Co., 147, Strand, London, W.C.

ARCHITECTURAL TERRACOTTA—
Gibbs and Canning, Ltd., Tamworth.

ARTISTS IN STAINED GLASS—
Bourne Swain, 61, King Edward-road, Birmingham.

ASPHALTE—
Avelines Sicilian Asphalte. Joseph Bernays, 96, Newgate-street, E.C.

BATH STONE—
Bath Stone Firms, Limited, Bath.

BOOKS—
B. T. Batsford (Professional), 52, High Holborn, London, W.C.

BRICKS—
Accrington Brick and Tile Co. (Facing Bricks, Plastic and Semi-Plastic), 8, St. James-street, Accrington.

Gibbs and Canning, Ltd. (White Glazed), Tamworth.

Heather Brick and Terracotta Co, near Ashby-de-la-Zouch

BRICK AND TILE MACHINERY—
Clayton Howlett Co., Woodfield-road, Harrow-road, W.

BUILDING COMPOSITION—
White, W., Great Western Works, Abergavenny.

CEMENT MANUFACTURERS—
Rugby Portland Cement Co., Rugby.

CEILING DECORATIONS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

CONCRETE—
Fambrini and Daniels, Excelsior Art Concrete Works, Lincoln.

CURTAIN BLINDS—
Heaton, J. Aldam, 26, Charlotte-street, Bedford-square, W.C.

ELECTRIC BELLS—
Gray, J. W., and Son, 9, Gracechurch-street, E.C.

FANLIGHT OPENERS—
Osborn, David, High-street, Berkhamsted.

FIREPROOF FLOORS—
Lindsay Neal, W. H., and Co., 15, North Wharf, Paddington.

FIREWOOD SPLITTING & BUNDLING MACHINERY—
Glover, M., and Co., Patentees and Saw Mill Engineers, Leeds.

GRANITE MERCHANTS—
Webb, Percy C., 41, Eastcheap, London, E.C.

HEATING APPARATUS—
Boyd, Jas, and Sons, Paisley.

Grundy, J, 30, Duncan-terrace, City-road, London, N.

HORTICULTURAL BUILDINGS—
Boyd, Jas., and Sons, Paisley.

Gloucester Railway and Carriage and Wagon Co, Gloucester.

HYDRAULIC RAMS—
Blake, John, Oxford-street Works, Accrington, Lancashire.

JOINERY—
Elliott, Saml., Albert Joinery Mills, Newbury.

Gloucester Railway and Carriage and Wagon Co., Gloucester.

LIGHTNING CONDUCTORS—
Gray, J. W., and Son, 9, Gracechurch-street, E.C.

LIME BURNERS—
Rugby Portland Cement Co., Rugby.

PAPERHANGINGS—
Land, J. and H., 93, Cannon-street, E.C.

PAVEMENT ROLLERS—
Gilchrist, Alex., 25, Eglinton-street, Glasgow.

PERSPECTIVES—
Finsbury Tracing and Drawing Office, 113, Pavement, E.C.

PHOTO-LITHOGRAPHY
Whiteman and Bass, 236, High Holborn, W.C.

PIPES—
Gibbs and Canning, Ltd. (Glazed Stoneware), Tamworth.

QUANTITY LITHOGRAPHERS—
Pettitt, T., and Co., 22 and 23, Frith-street, and 50, Old Compton-street, London, W.

RAIN WATER SEPARATORS—
Roberts, C. G., Haslemere, Surrey.

SANITARY APPLIANCES—
Gibbs and Canning, Ltd., Tamworth.

SINKS—
Gibbs and Canning, Ltd. (Cane-colour Glazed), Tamworth.

SPEAKING TUBES—
Gray, J. W., and Son, 9, Gracechurch-street, E.C.

SPECIAL ENGINEERING BRICKS—
Accrington Brick and Tile Co, 8, St. James-street, Accrington.

STAINED-GLASS—
Adam, Stephen, and Co. (formerly Adam and Small), Glasgow.

Camm, T. W, High-street, Smethwick, Birmingham.

STONE WORKING MACHINERY—
Powis Bale, M., and Co., Appold-street, London, E.C.

TELEPHONES—
Gray, J. W., and Son, 9, Gracechurch-street, E.C.

TERRA-COTTA—
Accrington Brick and Tile Co. (and Ornamental Brickwork), 8, St. James-street, Accrington.

Pulham, J., and Son, 50, Finsbury-square, and Broxbourne, Herts.

Thompson, Jabez, Northwich, Cheshire.

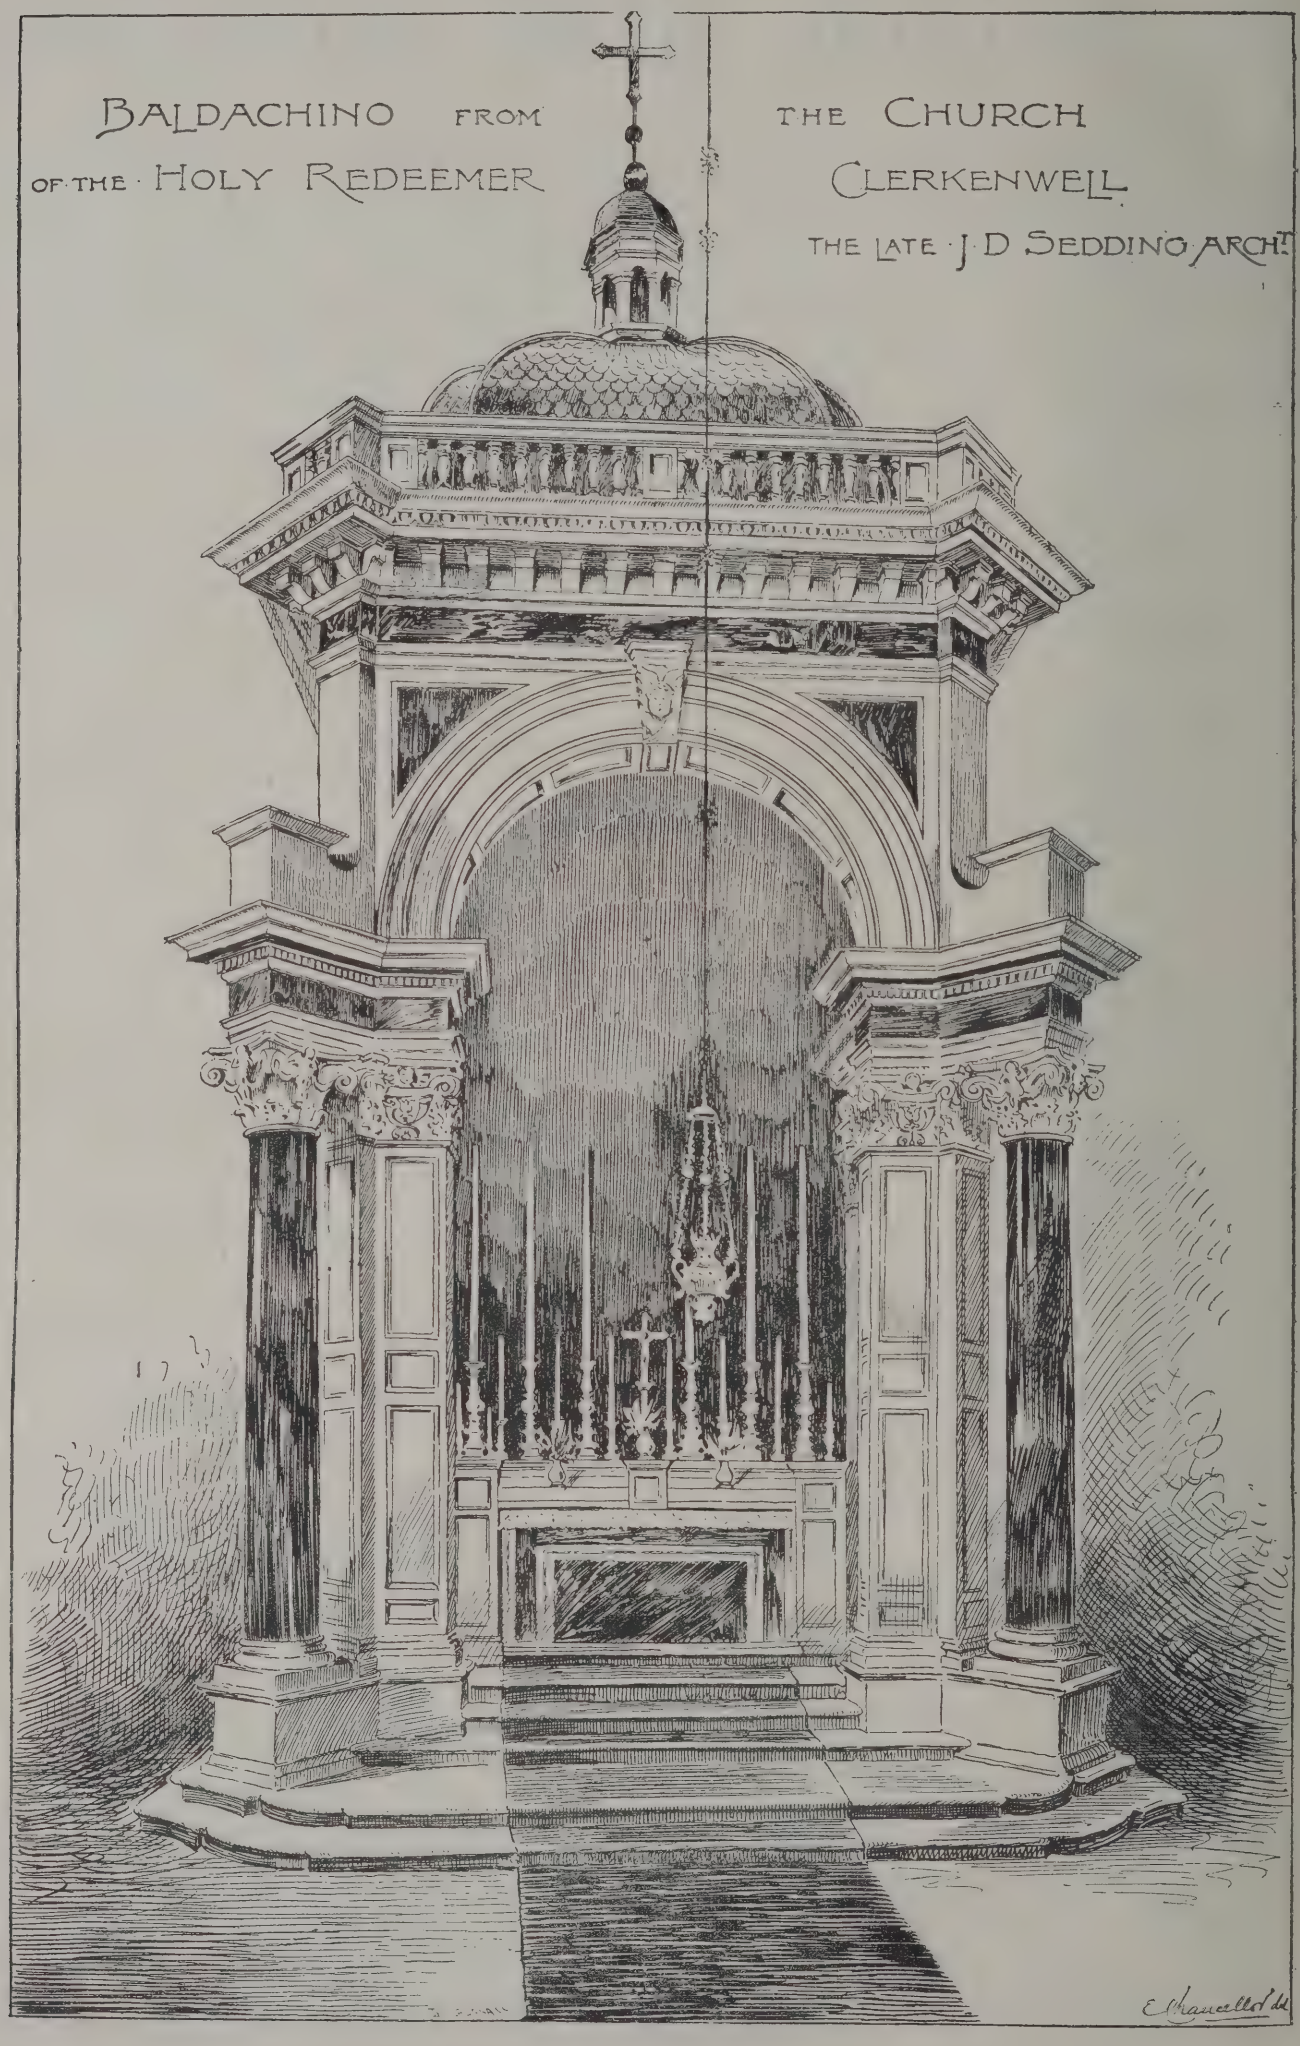
TILES—
Carter and Co. (Encaustic, Mosaic, and Faience), Poole, Dorset.

VENTILATION—
Buchan, W. P., R.P., S.E, 21, Renfrew-street, Glasgow.

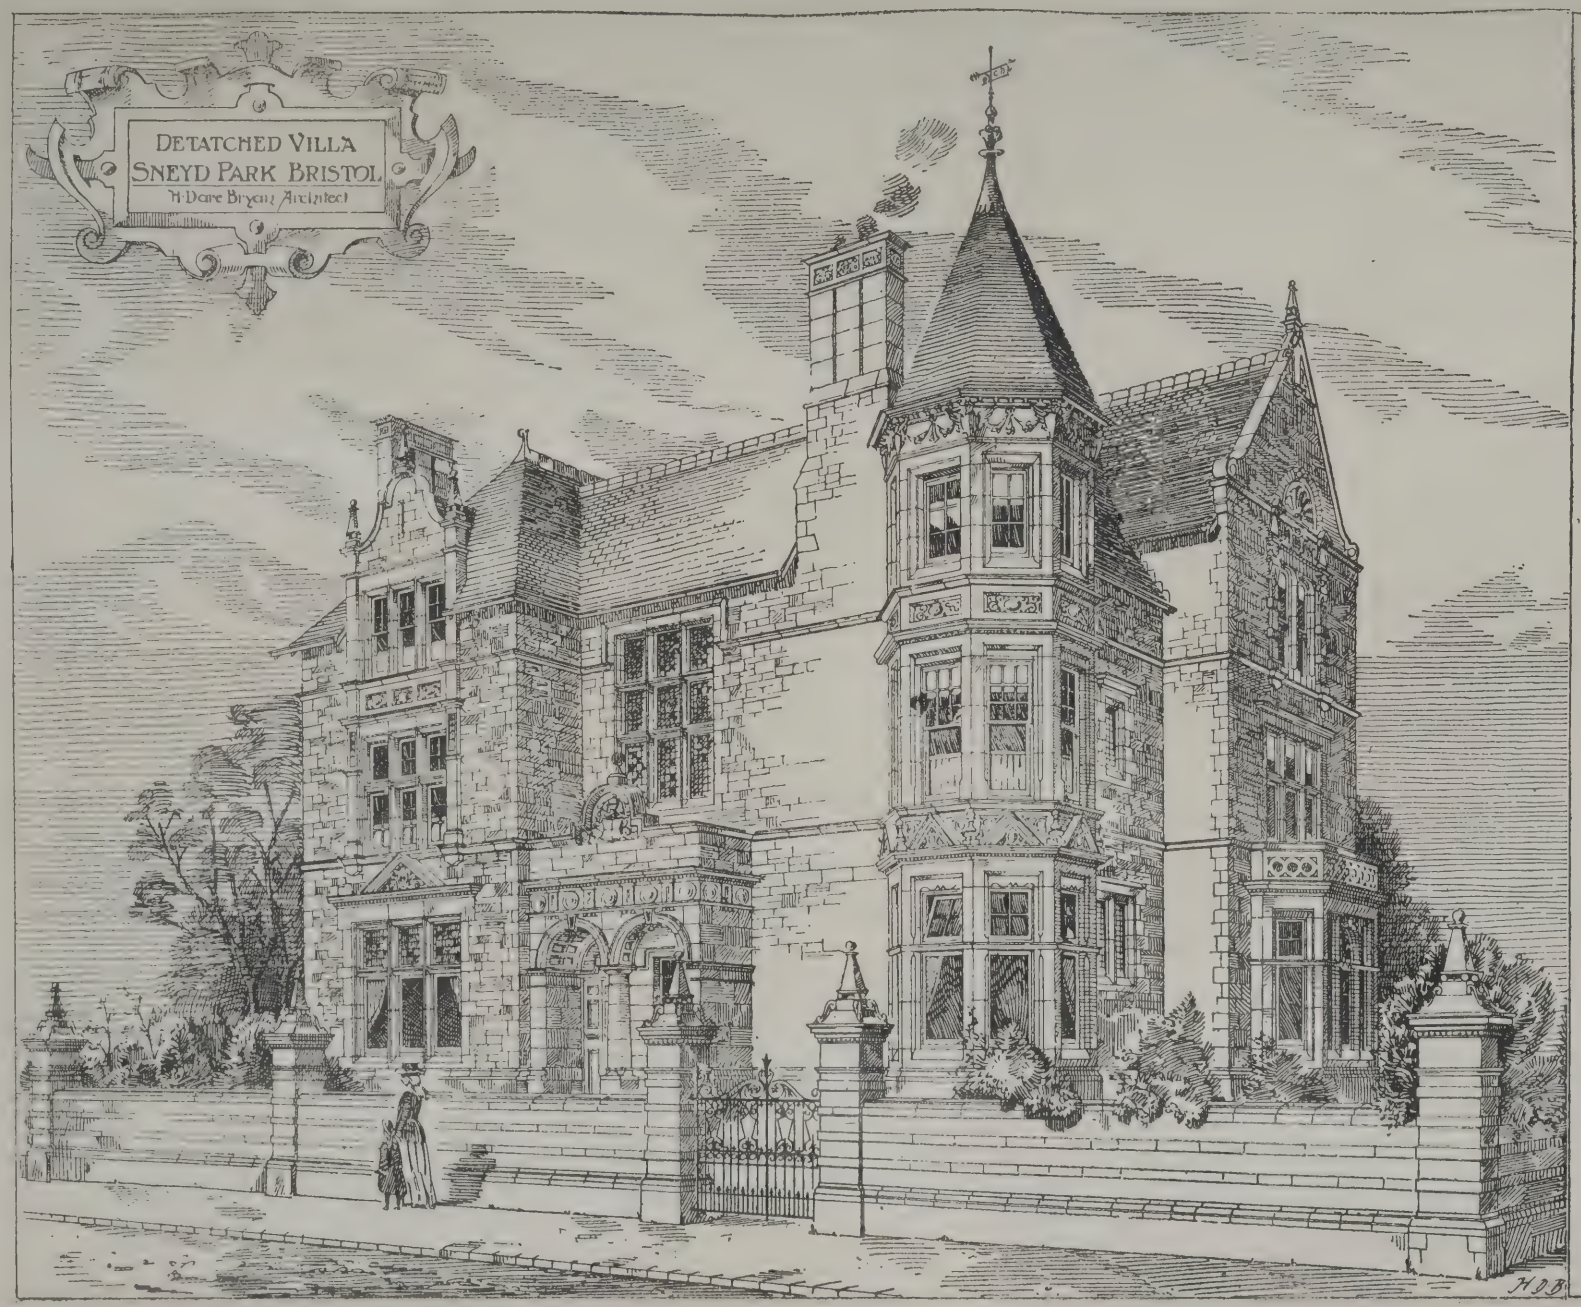
Gibbs, John, and Son, 27, South John-street, Liverpool.

Howorth, Jas, and Co, Victoria Works, Farnworth, Bolton.

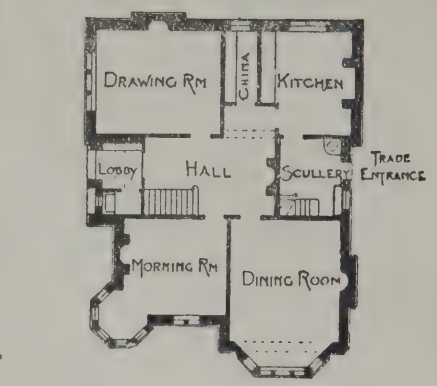
WOOD BLOCK FLOORING—
Gregory, T., and Co., Station Works, Clapham Junction, S.W



Lowe, Roger L., Worsley-road, Farnworth, Bolton.



WOOD-WORKING MACHINERY—
Reynolds, F. W., and Co., Acorn Works, Edward-street, Blackfriars-road, S.E.



WROUGHT IRON GATES, GRILLES, &c.—
Worrall (Specialist), Byrom-street, Liverpool.

BALDACHINO FROM THE CHURCH OF THE HOLY REDEEMER CLERKENWELL

THE LATE J. D SEDDING ARCHT

GROUND PLAN

FIRST FLOOR PLAN

WAYSIDE NOTES.

SOME ingenious gentleman has conceived a plan whereby not only may the murky waters of the Thames become a thing of the past, but the atmosphere of London be transformed from its present smoky condition to that of sunny Southern countries. I saw his communication in the last issue of this journal, and the hasty perusal then made has left an impression that these much-desired reforms are to be brought about by taking advantage of the fact that the sea-level on the western coasts of England is considerably higher than that on the south-eastern coasts. A canal was to be cut from some western point towards some portion of the upper reaches of the river, and then, presto! the water flows in one continuous stream, tides are done away with, a continuous current of pure water flows along the river's bed, thereby creating a continual draught through the City, and drawing away smoke and fogs, while the regurgitation of sewage in the Lower Thames is entirely prevented. What a glorious prospect! It may be urged that the tidal action of the river would prevent this scheme being carried into effect, by causing the flooding of one-half of London; but I think our ingenious friend has met this difficulty by proposing to construct another canal or water-way from below the City, through Kent, to the South Coast. Then I suppose the tidal river below London would be dammed, and not allowed to affect the waters above. It will, I think, be generally admitted that this suggestion is ingenious and possibly original, even if its practicability is doubted.

My mind reverted to this proposal, not because of any great merit perceived in the scheme, but because I would say, with emphasis, that if someone would construct forty such waterways and only do away with the fog, one would bless him and his posterity. When one has had to abandon a S.E.R. train on the outskirts of London as though it were a derelict at sea, and sneak through the Thames tunnel to get the better of the fog, and arrive by hook or crook at one's business, even if hours behind time, and then suddenly awake to the fact that the "B. N." appears earlier this week on account of the festive season—the said earlier appearance necessitating the raking together of notes some twenty-four hours before time as ordinarily—when I repeat, one has one's fill of fog up to the eyes, and has these experiences, and reflects that the topic of "A—a P. or an A. ?" is dead and buried, and no possible service any more as a peg for paragraphs, and that even to lean upon the "craftsman architect" is to lean upon a reed, that individual having proved to be a mere shadowy phantom—a bogey at the best—at such a time one thinks lovingly of would-be knights-errant against the fog-demon. At such a time, too, one scans desperately the morning papers to see if there is anything "moving,"—as the travellers say—in the architectural world,—whether an order in council has been made that architects shall receive 30 per cent. commission in place of five,—whether, in view of the aforesaid festive season, the Queen is about to confer knighthood upon all the signatories of the *Times* Memorial,—whether the Institute Council has unanimously resolved to support the Architects' Registration Bill, and by acclamation decided to offer free Fellowship to all members of the Society of Architects.

I look in vain. No one comes forward to agitate for the incarceration of all architects showing signs of mental derangement, *in re* arts and crafts, *et hoc*, &c., in lunatic asylumns; the grievances of competing architects remain unredressed by the Crown, and assistants still work overtime, and do not receive thirty shillings an hour for so doing. There is nothing new. I have had a mind to give it up and go a-skating on the plea of studying the ethics of curves of contrary flexure, acquiring a knowledge of the laws of impact, and investigating the stability and balance of sliding bodies. When one has the bad luck to suggest that competing architects are slack on the very day that a block of four competition advertisements appears, enthusiasm for architectural topic-making receives a damper, and the singing of Christmas carols in Conduit-street seems a safer occupation. My sheet-anchor of hope, the *Times*, even fails me this week, and I only see that Sir J. C. Robinson is not to be put down as to the Totnes Grammar-school, for all the town-clerks in Devonshire, but gamely replies that even if the old building has been altered and repaired in various stages of the world's history, it yet remains of passing interest, with its "quaint old doorway, mullioned windows with their diamond-paned casements and curious bell-turret on the roof," and forms "together with the Guildhall, which it adjoins, a group of ancient buildings of infinite picturesqueness and charm." The which readers, possibly, knew already, and may even be aware that the Society of Antiquaries have petitioned the Mayor of Totnes to interfere in behalf of the old building.

Here I am brought to anchor again, and fall to thinking egotistically that my pet job is now stopped by the frost, and feel sympathy with all others in a similar plight, and especially to regret that the bricklayers did not have open weather till at least Christmas Day, and thus be able to have more ninepences to lay out on their Christmas dinner. Talking to a friend a night or two ago, he remarked on the advisability of *well projecting* the coverings placed on incomplete brickwork, as frosts seemed to act in a *downward* direction, and the projection of the covering protected, to a great degree, the work below. In this view I concurred, pointing out as conclusive evidence of the correctness of his theory that, inasmuch as "frosts" at theatres originated in the gallery, they might therefore be said to descend. There was, perhaps, more science in his own argument, that the hoar-frost on the boards about a building stands in vertical needles, like iron filings clinging to a magnet, seeming to indicate some vertical magnetic or other influence. But now I reflect upon the matter, I rather fancy that the downward action is a long-recognised attribute of frost by scientists.

It was only the other day that a foreman was telling me a seasonable story about brickwork in frosty weather. In order to save some legal injunction, or other complication, a wall had to be built up in a few hours. There was a mighty frost, and the bricklayers worked all night. Fires were burning on the scaffold, and the cement was mixed in thimbles, or something smaller. *It froze on the trowels.* Nevertheless, the great object was accomplished. As day dawned, and a rosy hue outlined the chimneys and cowls of the neighbouring back addition, the work rapidly drew towards completion. Morning broke on "something accomplished, something done." *The wall was built.*

I wish all a Merry Christmas, and such innocent enjoyments as become the dignity of *the new architect.* Skating I confidently recommend as a means of striking such novel and delicate curves as shall be suited to the new architecture. Seriously, I wish all a happy holiday, such as architects who do architects' work with all its anxieties, continuous labours, and inevitable disappointments richly deserve. To all my readers I extend the heartiest wishes for Christmas wherever they may find themselves—by river, mead, or town, at home or abroad; and let them imagine I send them a card, the centre feature of which is an old English church, with its grey tower seeming, as all such do, to wear a glad-some face, as though proclaiming an everlasting peace on earth and goodwill towards men.

GOTH.

Mr. T. R. Wilkinson, of Manchester, has presented to the National Portrait Gallery in London a portrait of the eminent sculptor, John Flaxman, R.A., painted at Rome by Guy Head in 1792. He has also given to the National Collection, South Kensington Museum, a representative picture by William Bradley, "Early Fruit." Both pictures were in the collection of the late Mr. Robert Crozier, president of the Manchester Academy of Fine Arts, dispersed by auction at Christie's on Wednesday week.

A pulpit has been placed in the Church of St. John the Evangelist, Stand, near Manchester, as a memorial of the late vicar. The pulpit is of red-veined alabaster, with a base of Hopton Wood stone. Around the pulpit are three niches with green marble shafts. Two of the niches contain tracery, and the centre one holds the figure of St. John, accompanied by his eagle, carved in white alabaster. The work has been carried out by Messrs. Earp and Hobbs, sculptors, from the drawings and under the direction of Mr. J. Medland Taylor, the architect of the church.

PUBLIC BATHS AND WASH-HOUSES, HORNSEY ROAD, N.

WE publish to-day the perspective view and a block plan of the design selected by the commissioners in their recent competition, the buildings for which are now in course of erection. The author is Mr. A. Hessell Tiltman, F.R.I.B.A., of 70, Torrington-square, London, who, it will be remembered, defeated his fellow competitors in the competition by submitting two designs, which were awarded by the arbitrator respectively first and second premiums. The following particulars have been furnished:—The accommodation consists of three swimming-baths, the water surfaces of which are—First-class, men's, 132ft. by 40ft., with large galleries; the second-class, men's, 100ft. by 35ft.; and the women's, 75ft. by 25ft. Right and left of the first-class swimming-bath (which occupies the central part of the building) are the slipper-baths, 105 in number, divided as follows: Men's—18 first class, 54 second class; Women's—10 first class, 23 second class. A committee-room for the commissioners, and the requisite accommodation by way of waiting-rooms, pay-boxes, &c., have been provided. This part of the building has been specially arranged so that the first-class swimming-bath may be adapted, in the winter months, for use as a place of entertainment. On the left-hand side of the quadrangle will be found the public laundry, which comprises a public washhouse, accommodating fifty washers, with a like number of drying horses; ironing-room and the requisite waiting and cloak-rooms. The boiler-house, together with the establishment laundry, are provided for in a half-basement under the public laundry. The view published to-day shows only the central block in the main front facing the Hornsey-road, through three arches of which access is obtained to the quadrangle shown upon the block plan, and from which all parts of the baths and washhouse proper are entered. The upper portion of the central block is appropriated to the use of the resident superintendent, and also of a resident engineer. The shops and houses shown right and left of the central block are not included in the scheme of the commissioners' own operations. The portion of the work now in hand is being carried out by Messrs. Macfarlane Bros., of Hornsey-road, N., at a cost of £27,481.

SCHOOLS OF ART.

LONDON SCIENCE AND ART SCHOOLS.—A largely-attended meeting of the sppporters and teachers of London science and art schools and classes was held on Saturday at the Charterhouse School, Goswell-road, to determine the terms of memorials to the next London County Council, to the Charity Commissioners, and to the City Guilds, praying for "the endowment of technical education in the metropolitan science and art schools and classes." Sir A. K. Rollitt, LL.D., M.P., who presided, said that the very basis of technical education was primary education, and the immediate foundation of all technical education worthy of the name was science and art teaching. Having attended many meetings of science and art schools in London and the provinces, he was convinced that, if there were one department of State which had done better service than almost any other, it was the Science and Art Department, under which they worked. The memorial to be presented to the next London County Council, the terms of which were approved after some slight revision, laid stress upon the fact that during the past 50 years 500,000 adult students had been instructed in the art and science schools and classes in London—organisations which were now threatened with impoverishment unless the County Council came to their aid with grants from the revenue which they received under the Local Taxation Act, and which were expressly intended to maintain and advance technical education. While that Act remained in force, the Science and Art Directory had determined to suspend from the 31st inst. all grants for fittings, apparatus, and examples; and from May next all payments for the second-class in the elementary stage of each science subject would cease. Other memorials to the Charity Commissioners and the City Guilds soliciting monetary assistance were likewise adopted. A deputation was appointed to present the petition to the new County Council.

We understand that the floors at Sandringham, recently destroyed by fire, have been reconstructed on Messrs. Homan and Rodgers' patent system.

PRICES.—XXVII.*

(All Prices Include Profit).

JOINER (*continued*).

CEMENTS AND MORTAR MIXING.

SOME valuable notes on cements, mortars, and concretes are given in a paper by Mr. William H. Grant before the American Society of Civil Engineers. The notes were made while superintending the construction of the Naval Observatory on Georgetown Heights, Washington, these being all fireproof, the foundations deep, and the walls thick, of brick, gneiss, and marble. The following requirements for cement were proposed, this cement to be best imported Portland. For fineness it was necessary to pass a sieve of 2,500 meshes with a residuum of not over 5 per cent; for set, neat, the initial set to be in not less than 20 minutes; for tensile strength, for seven days, 360lb. to 375lb.; the domestic cements were, for fineness, to pass a sieve of 2,500 meshes with a residuum of not over 8 per cent.; for set, neat, initial set in not less than 20 minutes; for tensile strength, neat, one day, 40lb. to 50lb.; seven days 90lb. These tests were not rigidly adhered to, as it was impossible to procure cement in quantities necessary to carry out the work without interruption. The author recounts the irregularities and shortcomings of the six brands of cement tried, only two of which were retained. The age it was impossible to obtain. The barrels ranged in weight from 368lb. to 402lb. net, making differences of 34lb., the average was 378lb. per barrel, or 18 per cent. under the standard weight of 400lb. net. The variations in quality were considerable; the initial set was variable, the general range being from 17 to 60 minutes. The tensile strength was also irregular. One-day tests gave from 50lb. to 200lb., average 108lb. The average of all, 369lb.; the highest of a few, 700lb. A few twenty-eight-day tests gave 405lb. to 670lb. The variations in the domestic cement were greater, and out of eight brands only one was continued—a cement largely used in Washington, from the Upper Potomac, but which is very variable. The average weight of barrels was 280lb. net, varying from 256lb. to 334lb., the net weight seven per cent. below the standard of 300lb.; but the set and tensile strength varied very much. The best of this cement showed a tensile strength neat for seven days of 100lb. to 191lb., though some went up to 250lb. The author refers to a few points which bear upon the subject of cements and mortars, and require careful supervision. 1. In mixing mortar, the liability of error in hand-mixing in measuring out correct proportions; the quantity of sand will vary as it is wet or dry, hence the value of mixing by machinery. The admixture of cement and sand is not uniform; all barrels of cement are assumed to contain equal quantities. 2. The second set of material, by adding water and re-mixing, is apt to be used to the detriment and the weakening of the mortar. 3. Laying brick without wetting is often the cause of bad work. 4. Bedding brick, laying it in full bed of mortar, filling end and side joints in one operation, is neglected; the vertical joints are left. 5. Grouting, which is not desirable in the execution of sound work. The paper contains other observations on mortar and testing cement. The subject of concretes, with experimental results, is a further topic discussed. The "personal equation" in testing cements or mixing mortar is no doubt very important, and often neglected in large works, where it cannot be discovered.

BOOKS RECEIVED.

A Practical Treatise upon Warming Buildings by Hot Water. By CHARLES HOOD, F.R.S., and re-written by FREDERICK DYE, author of "Hot-Water Supply," &c. (London: E. and F. N. Spon.)—Mr. Dye, whose series of articles on "Hot-Water Engineering" in our pages has lately been completed, has undertaken the re-compilation of Mr. Hood's well-known treatise on Warming Buildings, and the bulky volume on our desk shows that the editor has availed himself of every new method and appliance. In looking over the treatise we find the original author's rules and principles have been retained; but the work has been greatly expanded by the addition of a chapter upon the laws of heat in its application to heating by hot-water. The conduction and radiation of heat and connection, and the actions resulting therefrom, are fully treated. Another chapter deals with the theory of circulation of water, in which Hood's theory is quoted, and the diagrams of different methods of the descending or return-pipe will be found of value to the student who is desirous of making himself familiar with the theory of circulation. Other elementary matters, such as air in pipes, air-pipes and cocks, provision to replenish loss by evaporation, supply cisterns, position of cistern and connections, follow; and Mr. Dye is here abreast of the times, and points out the advantages of certain methods of and materials for making air tubes, and the avoidance of defects, such as downward dips in the pipe above. The proper position of cisterns, irregular forms of apparatus, and the faults of dipping pipes below doorways are discussed, the author showing very clearly the mistake of doing anything to impede the circulation or motive power, which depends on the increase of vertical length of the flow and return pipes. That a dip causes a check is easily proved, as shown on pages 65 *et seq.*, and young architects will do well to study this portion of the treatise, with the suggestions that follow. The examples of engravings given of hot-water apparatus, from very simple to more elaborate forms, are of practical value, and the details and forms of apparatus suitable for hothouses, halls, and buildings are fully discussed. Many forms of boilers, both horizontal and vertical, are illustrated, including such well-known types as Keith's, Weeks and Co's. Examples of low and high pressure apparatus for buildings, and the methods of connecting radiators and coils, are discussed, the author pointing out the merits of each invention. Warming by hot air, and the valuable appliances of E. H. Shorland, Constantine and Son's convoluted stoves; types of radiators, horticultural work, and appliances and fittings for all sorts of buildings are illustrated and described. The statutory regulations of the Metropolitan Building Acts as they affect heating are usefully appended to this very complete and practical guide to warming.——Chubb and Sons' Lock and Safe Company issue a remarkably neat and handy little Diary and Almanac for 1892, giving a most useful record of great fires and robberies.——*The City Diary and Almanac* (London: W. H. and L. Collingridge) is issued for the twenty-ninth time.—— The *Practical Catechism.* By ROBERT GRIMSHAW, M.E., Ph.D. (New York: John Wiley and Sons).—This is a small but useful little book in catechetical form. The author has taken the questions from various sources—manufacturers, merchants, consumers, railway men; some have been questions in various scientific journals, others are legal, the result of which is that the questions are devoid of that unreal character found in ordinary school catechisms. Under "Building" we find this question, "Is there any way of making slate roofs with a very flat pitch? A. They have been laid with a pitch as flat as only ¼in. per foot; each slate being exposed full face to the weather, and laid in cement consisting of liquid coal-tar thickened with cement or ground slate, slaked lime, and linseed oil; the compound being applied hot and the joints payed." Further on the following maximum loads are given for floors in addition to weight of floor itself: For steel bridges, 80lb. per square foot; dwelling floors, 40lb.; churches, theatres, and ball-rooms, 80lb.; warehouses, 250lb.; factories, 200lb. to 400lb. These, we presume, are only approximate. Building stones; calculations of areas, including the puzzling irregular figure; cements; chemical technology, colouring metal, disinfectants, fluxes, foods, foundry practice, various engineering questions, strength of beams and materials, ventilation, &c., are among the subjects treated, these being arranged in alphabetical order. The answers are, in most cases, eminently practical, and are of a kind not to be found in ordinary textbooks. Mr. Grimshaw's little book will be a valuable addition to the practical engineers' and general students' library.

An exhibition of wood-carving, repoussé work, hammered iron, and other house industries is on view at the Grosvenor Hall, East Grinstead. The formal opening took place on Wednesday week.

Building Intelligence.

Burton-on-Trent.—A number of additional improvements have just been completed in St. Paul's Church, Lord Burton, the patron, again defraying the entire cost. A sacristy has been erected of stone on the north side of the chancel. The interior is octagonal in form, and each panel carries an inscription in Latin, while the three-light window has been filled-in with stained glass, representing the Crucifixion and the Passion. Outside there is a figure of St. Paul, under a canopy, the work of Messrs. Farmer and Brindley. The choir vestry has been improved and enlarged; bracketing has been placed over the arcading in the north transept wall, and the arcades are to be filled-in with saints. A 12ft. high cross has been placed in front of the chancel arch, and this, among other things, bears the text, "God so loved the world," while windows have been inserted above, in which appear figures of angels looking with adoration on the cross and the censers. The side chapel has been enlarged by the removal of a clergy vestry, and memorial windows are being placed therein. The side windows will bear figures of saints. The second Communion table has been moved to beneath the east window, and an alabaster retable has been added. The stone work has been carried out by Mr. G. Hodges, of Burton; the woodwork by Messrs. Rattee and Kett, of Cambridge; and the stained-glass windows by Messrs. Barlison and Grylls, of London. All has been done under the superintendence and from the designs of Mr. G. F. Bodley, A.R.A.

Leatherhead.—The parish church was re-opened on Tuesday week after restoration effected at a cost of £2,500. In 1873 the whole of the church was reseated in oak, and a new roof was built to the chancel and transepts. The present restoration has consisted in placing a new roof to the nave on the lines of the original roof, the reopening of the old porch, the building of a choir vestry at the west end of the south aisle, the formation of a new arch to complete the north arcade, the rebuilding of the chancel arch, and restoration of the rood loft, the removal of west, north, and south galleries, the paving of nave and aisle with wood blocks laid on concrete, and the opening of the tower to the nave of the church. A mosaic pavement with marble steps, and new altar-rails have been given as memorials. The works have been carried out by Messrs. Longley, builders, of Crawley, under the direction of Sir Arthur Blomfield, A.R.A. Mr. Huntley was the clerk of the works.

Manchester.—A new Parcel Post-Office in Moreton-street, Strangeways, close to the Victoria and Exchange railway stations, was opened on Saturday, and is said to be the largest and best-appointed building of its kind out of London. The sorting-office alone measures 226ft. by 70ft., and is surrounded by a gallery 23ft. wide. Covered yards are provided at each end of the office for the arrival and despatch of the mail vans. There are also offices and retiring-rooms for the staff, which numbers more than 100 persons at ordinary times. When the building is completed there will be a public office with entrance from New Bridge-street. A large room in the basement, having the same dimensions as the sorting-office, will be used as a basket store-room. Light is obtained in the daytime from windows on either side and from a considerable area of glass in the roof. Concrete and fireproof floors and walls have been constructed throughout, so as to reduce the risks from fire. The new buildings were designed by Mr. Henry Tanner, of Her Majesty's Office of Works, London, and executed by Messrs. Robert Neill and Sons, of Manchester.

Rochester.—As briefly noted by us last week, a movement has been set on foot, chiefly at the suggestion of the Dean (Dr. Hole), for the complete restoration of Rochester Cathedral, on which a sum of nearly £20,000 has been expended during the last few years. It is now proposed to complete the western front, to raise the roofs of the choir and transepts, and to add a lofty spire to the present central tower. This, it is anticipated, will require a further expenditure of £20,000. Subscriptions amounting to between £2,000 and £3,000 have been already announced.

Spital-square, E.C.—On Wednesday week the Chancellor of the Exchequer presided at the opening ceremony in connection with the new girls' school in Spital-square, Bishopsgate. The new buildings have been erected on the south side of Spital-square, in place of the school buildings formerly situated in Skinner-street and Primrose-street, and comprise large schools, a chapel 63ft. by 44ft., and curate's residence. The new structures have been designed to accommodate 550 pupils, and are planned to meet the requirements of a modern middle-class girls' school. The style is Collegiate, of the Jacobean period. The buildings have been designed and carried out by Messrs. T. Chatfeild Clarke and Son, architects, 63, Bishopsgate-street, Within. The contractors were Messrs. Woodward and Co., 13, Wilson-street, Finsbury, and Mr. P. J. King was the clerk of works. The total cost of the buildings has been about £18,000, which is exclusive of the value of the land. The school was illustrated in the Building News of Oct. 2 last.

Upton Park.—The new vicarage for the parish of St. Stephen's, Upton Park, which has been in course of erection for the last six months, was completed and ready for occupation the early part of last month. The vicarage has been erected from moneys supplied by the Governors of Queen Anne's Bounty and the Ecclesiastical Commissioners for England. The total cost has been £1,316. On the ground floor the dining-room and study are connected by folding-doors, so that when required for parish purposes the two can be thrown into one, and make a room 37ft. by 15ft. There is, in addition, a small private study for the clergyman, and all the usual domestic offices on the same floor. The building has been carried out from the design and under the superintendence of Mr. H. Herbert Francis, architect, of Palmerston-buildings, London, and Loughton, Essex; and the builder, Mr. Charles Foster, of Loughton, has fulfilled his contract in a very satisfactory manner.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Edinburgh Architectural Association.—A meeting of this society was held on Thursday, the 17th inst., Mr. John Kinross, president, in the chair. Mr. Jamer Bruce, W.S., moved a resolution requesting the Government to take steps without delay for restoring the Royal Palace of Linlithgow, which has been in a roofless state since the fire of 1746. Mr. Thomas Ross, architect, in seconding the motion, stated that the present state of the palace was simply deplorable from an historical and architectural point of view. The motion was unanimously adopted, and it was agreed to forward copies of it to the First Commissioner of Her Majesty's Works, to the Secretary for Scotland, and to the Lord Advocate. Mr. G. Aitken, architect, gave notice of a motion in favour of the removal of the Wellington Statue from its present site, on the grounds chiefly that it was now an obstruction to the thoroughfare, and that it was incongruous with its surroundings. Mr. J. M. Gray, curator of the Scottish National Portrait Gallery, afterwards read a paper on "Sir Henry Raeburn and Portraiture in Scotland." Having pointed out the historical value of portraiture, Mr. Gray remarked that in Scotland the usual sources of portraiture were sepulchral slabs and brasses, illuminated manuscripts, and coins, and sometimes charters. Dealing specifically with painted portraiture, Mr. Gray described, as one of the first great examples, splendid as a specimen of religious and art portraiture alike, the altar-piece of Trinity College Church, Edinburgh, now preserved in Holyrood — one of the finest examples of Early Flemish art in Britain, and certainly by far the finest in Scotland. Then Mr. Gray treated of the portraiture of Queen Mary's time, taking particular note of the portraits of the ill-fated Queen herself. There was no doubt, he concluded, as to what Queen Mary was really like, though, as most of the artists who portrayed her were comparatively poor painters, we did not realise the beauty and loveliness attributed to her, but had, as it were, a map of her features. Mr. Gray next directed attention to some of the leading Scottish portraitists of succeeding centuries, giving particular notice to George Jamesone, William Aikman, and Allan Ramsay the younger —until he came to Raeburn, the Scottish portraitist, said the lecturer, in whose best work they found almost at its highest the purely æsthetic value that came from technique, from the masterly use of material, and one in whom they found this purely sensuous charm united to the very utmost value of record. No other Scottish portrait painter was worthy to stand by his side. The only other Scottish artist fit to be named in the same breath was a *genre* painter, David Wilkie. On the motion of Dr. Marshall, rector of the High School, seconded by Mr. James Orrock, R.I., London, Mr. Gray was thanked for his paper.

Glasgow Archæological Society.—The members of the Glasgow Archæological Society held a meeting on the 17th inst. in the Hall, Bath-street, Glasgow, Mr. C. D. Donald presiding, when Mr. William Jolly read his third report on "The Exploration of the Antonine Wall," and Mr. George Neilson submitted a paper on "The Purpose of the Periodic Expansions on the Antonine Wall." Mr. P. Macgregor Chalmers also read a paper on "The Vallum, Berm, and Fosse: their Correlation," and Mr. James Lang spoke on "The Theory of a Berm between a Rampart and a Fosse."

The Electric Lighting of Houses.—At the meeting of the Dundee Institute of Architecture, Science, and Art, held on the 10th inst., a lecture was delivered on the electric lighting of houses by Mr. T. Grant Ogilvy, Principal of the Heriot-Watt College, Edinburgh. Mr. Charles Ower, president of the institute, occupied the chair. The lecturer first explained the nature of electric light by a series of illustrations. He then described how the light could be distributed by means of wires in dwelling-houses, and exhibited a box of fittings to the audience. These consisted of "leads," "glow lamps," "switches," and other appliances. The fitting up of the "leads" on houses was also explained. In providing electric lighting in houses much more decorative art could be displayed than in gas-fittings. The light could be more advantageously placed for illuminating the rooms of houses, while, by the arrangement of "switches," it could be lighted up at once by the touch of the switch at the door, or shut off altogether when not required. Referring to the cost of electric lighting as compared with gas, he said that a 16-candle electric glow lamp gave a light equal to a No. 5 gas-burner. A No. 5 burner consumed 5c.ft. of gas an hour, and that was at the rate of 1,000ft. of gas in 1,200 hours. The electric lamp would produce the same effect, and consume an equal quantity of electricity in the above time, and at the rate at which electricity was charged, with the cost of the lamp added, the price would amount to 6s. 6d., which was twice the price of gas as it was sold in Dundee. As against that, electricity could be more economically used, and it did not vitiate the atmosphere as the burning of coal-gas did. The adoption of electric lighting in large warehouses and shops would be greatly conducive to the health of shop assistants.

CHIPS.

A movement is on foot for placing a portrait of Mr. Alfred Waterhouse, R.A., the ex-president of the R.I.B.A., in the Institute room, at 9, Conduit-street. The proposal, as was to be expected, is being well taken up, and already 300 members of the Institute have promised subscriptions.

The County Council of Kent having been saddled by a recent legal decision with responsibilities as to the maintenance of footpaths on main roads, is apparently preparing to meet them. The county surveyor has issued a series of questions having reference to the nature and cost of the material used in footpaths, the durability of the materials, and the average expenditure during a series of years on the paths.

Messrs. John Ellis and Sons, of 8, Market-street, Leicester, the proprietors of the great Barrow-on-Soar Lime and Cement Works, have issued a very interesting and useful almanack for 1892, giving, besides the usual calendar and other useful information, an accurate series of representations of fossils from the blue lias limestone at their quarries.

New buildings for the Hampshire County Council are about to be erected at Castle Hill, Winchester, from plans by the county surveyor, Mr. J. Robinson, C.E. The quantities are being prepared by Mr. Henry Lovegrove, of London, who has been appointed by the council for that purpose.

The foundation-stone of the new assembly rooms to be added to the town hall at Dalkey, was formally laid last week. Mr. Higginson, of Dalkey, and recently one of the town commissioners, is the contractor.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to J. PASSMORE EDWARDS.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India (viâ Brindisi), £1 10s. 4d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front Page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No front page or paragraph Advertisement inserted for less than 5s.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING for TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page advertisements and alterations in serial advertisements must reach the office by Tuesday Morning to secure insertion.

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., L., LI., LIII., LIV., LVIII., LIX., and LX. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—C. G. R.—G. and C.—J. P. and Son.—W. W.—J. A. H.—R. B. C. Co.—J. B. and Sons.—J. G.

"BUILDING NEWS" DESIGNING CLUB.

DRAWINGS RECEIVED.—"Filiolis," "Plan," "Peterborough," "Unitate Fortior," "Smilash the Goth," "Old Postage Stamp," "An Old Hand," "Nil Nisi Bonum," "Vulcan," "Sniklaw," "Jamrach," "La Cigale," "Mars," "Q. E. F.," "Mica."

Correspondence.

THE ARTY-CRAFTY ARCHITECT.

To the Editor of the BUILDING NEWS.

SIR,—The year closes with a plethora of dangerous art cant. Mr. H. Wilson, a week or two back, favoured the Architectural Association with a burst of maudlin, dreamy impossibility, which none but an Architectural Association could have listened to with patience. Let him go and work his stone, lay his bricks, forge his metal, and do his plumbing-work himself, on the building, and see where his hands, his mind, and his time are for his business as an architect. And if he thinks that that heterogeneous collection of architectural bits named Holy Trinity Church, Sloane-street, and that hideous structure in Exmouth-street, Clerkenwell, used as a church, are a sufficient result for the character of work he preaches, he is entitled to his self-satisfaction. But even such feverish nonsense as that thrust into the ears of the young men of the A. A. could not be closed without the usual fling at that searching system of examination at work at the Institute which is so distasteful to those who wish to leap at a bound, upon the backs of their pretty sketches, into the position of a full-fledged architect.

Then comes Mr. T. G. Jackson, who also selects the A. A. as the fittest arena for his disquisition on the training of architects; but Mr. Jackson now is not the Mr. Jackson of "Memorialist" fame. Then construction and business were far beneath the notice of the lofty art-architect: now construction, and even specification-writing, would appear to be not unimportant parts of an architect's training. Further, even a little archæology and study of the history of architecture are not utterly condemned; so that, without admitting it, Mr. Jackson comes really to that very curriculum upon which the Institute examines. Now, what has caused this sudden transformation? Has the *Times* leader taught the "Memorialists" that the public have been awakened to their tricks and their shams, their cant and their deceit? Are they unable to point to enough "art" amongst them in London to atone for the employment of the engineer and the agent? Has Mr. William H. White, in his pungent and sound commonsense paper read before the Sheffield Society of Architects the other day, made them tremble for that little five per cent., which even the soaring heights of their sublimest art-feeling will not permit them to forget? Do they fear that the public will be taught that two per cent. is enough for all the sort of art they can find in London, and that the remaining three will go to the engineer and the agent? It seems very much like it. Of course, Mr. Jackson touched the hearts of certain A.A. members who have yet to deal with bricks, mortar, and the builder. When they have had as much experience as Professor Kerr in the realities of an architect's life, they will wonder how they could have been taken in by the effusions of those who are mere infants in practice as compared with the Professor. But it is not because Professor Kerr has passed through the fire of constructive knowledge and business aptitude that therefore he is not in the highest degree as much a lover and disseminator of art as any of these new-fangled arty-crafty men who seem to be positively crying for a good whipping and relegation to the rudiments of their business! Mr. Reginald T. Blomfield need not worry himself about the Memorialists "coming over" to the Institute. As, of course, a mere unit of that body, representing nobody but myself, I say that we are better without them. It is, or should be, an Institute of "Architects."

But, Sir, although to those who are able to discount the foolish talk of these wild theorists, little harm is done, there can be no doubt that such papers as the two last read at the A. A. must have a very injurious effect upon the receptive minds of architectural students. It is a subject of regret that some decided protest is not issued by the Institute to the Association against the pernicious doctrines which the latter appear to encourage; and it would not be amiss to publish, for the benefit of all parents and guardians, a warning that their sons—architects' pupils—are being taught erroneous views, which will certainly land them and their clients in hopeless difficulties in the future.—I am, &c.,

WM. WOODWARD.

13, Southampton-street, Strand.

ROCHESTER CATHEDRAL.

SIR,—I have read, with feelings of dismay, a paragraph in the *Daily Telegraph* to the effect that "Dean Hole, of Rochester, has started a *comprehensive scheme* for the restoration of the fine old Norman cathedral of that city. *The plan is sufficiently ambitious;* it includes the placing of a lofty spire, *intended* to be the loftiest in England, on the *existing* tower, and the restoration of the west front."

So far as the latter portion of the "scheme" is concerned, by all means go on with it, but with the greatest discretion. But the *loftiest spire in England* on the *existing tower*—good heavens!!!—or on the existing cathedral even. Perhaps the next thing we shall hear of will be that in this most "comprehensive scheme" the Very Rev. Dean will have the fine old *Norman* cathedral *lengthened* east and west, in order to bring it into due *proportion* with the modern giant which is at present "in the air." There *may* it be (indeed, anywhere but Rochester), I feel sure, will be the prayer of all true lovers of our national architecture. I inclose my card, and remain—Yours, &c., H. E. J.

THE BUILDING ACT.

SIR,—On page 889 of your last issue a Mr. T. Henry Bartlett goes out of his way to pitch into the district surveyors. I do not know what right he has to set up as a judge; but he should know that about two years since the three leading societies connected with the building world recommended that no change be made in the duties and appointment of district surveyors. The fee system of payment is much the best, as it causes the officer to be active and vigilant, while the remuneration is proportionate to the work done.

As regards the question of district surveyors, there can be no doubt about the result of the change made by the County Council; very inferior men will apply for the posts—men who are young and cannot get work, and men who have reached forty years of age and found themselves failures. The old system produced good men. Look down the list of the London District Surveyors, and you will find at least sixty men who would never have offered themselves if they had not been allowed to practise. Mr. Bartlett's suggestion of a tribunal in the place of the Building Act Committee is excellent; but not, I think, new.—I am, &c., OBSERVER.

ROGERS v. JAMES.

SIR,—It is at times difficult to understand the decisions given by judges, and one cannot help feeling that Mr. Frederick Rogers has been hardly treated. It appears to me that if a distinct order had been given for the variations all would have been well; but these variations were chiefly made by the builder without instructions from the architect, who found them out afterwards, and then deducted their value.

In the reports of the case we hear nothing of the client being injured, as the variations are adjusted in the usual way. I know nothing of the case, except from the newspaper reports, so cannot tell why the jury awarded £58 on a job amounting to £2,500.—I am, &c.,

HENRY LOVEGROVE.

26, Budge-row, E.C.

CHIPS.

A meeting of the Association of Birmingham Students of the Institution of Civil Engineers was held at the Midland Institute on Thursday evening last, when the president, Mr. J. Edward Willcox, A.M.I.C.E., delivered a lecture on "The Details of Plumbing Work," which was illustrated by numerous diagrams. An interesting discussion followed.

The Barrow-in-Furness Board Schools are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Mr. E. H. Shorland, of Manchester.

The Local Government Board have just sanctioned a storm outfall drainage scheme at Leicester, estimated to cost £71,000, and the erection of two new refuse destructors, to cost £18,000 (exclusive of site), which works have been designed by the borough engineer, Mr. E. G. Mawbey, C.E. The storm outfall drainage scheme consists for the most part of a culvert down the valley of the Soar some 3¾ miles long, with a diameter of 8ft., and a discharging capacity of about 70,000,000 gallons per day, in order to give a free outfall into the river Soar for the main sewers of the town whenever the pumps are overpowered. We understand that these works will be proceeded with as soon as the contracts can be got out.

On Saturday a stained-glass window was unveiled at Ince parish church. The subject is the two sisters of Bethany, and the work has been carried out from designs by Messrs. Heaton, Butler, and Bayne.

Mr. Lemon, the mayor of Southampton, has been appointed to act as engineer to superintend the reconstruction and completion of sewerage works at Richmond. Mr. Lemon has also been appointed consulting engineer to the Poole Town Council.

All Saints' Church, Hertford, was completely destroyed by fire on Monday morning. The fire was discovered at five o'clock, and it then had such a hold upon the building that there was no chance of subduing it. A valuable organ and several memorial windows were destroyed. The only things saved from the fire were the old registers. Last Sunday night the church was broken into by burglars. The building is partially insured.

Madame Schliemann has decided to go on with the excavations commenced by her late husband at Hissarlik, but on a rather smaller scale than when he was alive. The work will be continued until the so-called "old town" has been entirely brought to light again.

The town council of Maidstone have decided, in the words of the resolution, to erect a "perfectly-planned" technical school upon, or in close proximity to, the present museum premises, and have allotted, towards the cost of building such a perfectly planned edifice, the sum of £4,500. Perfection in planning will be sought for with the aid of a competition.

Intercommunication.

QUESTIONS.

[10684.]—**Strength of Materials.**—There is a question in the paper on Strength of Materials, &c., in the Examination in Architecture held by the R.I.B.A. in March last, I think, wherein it is wished that the student will point out what weight placed in the centre of a beam will equal certain irregular weights caused by piers resting on the beam at various intervals. I should be glad to know how these irregular weights can be equal to a central load, as in my studies in this subject, I have never seen any reference to the possibilities of such equality in any way.—A. R. F. T.

REPLIES.

[10663.]—**Timber.**—Mr. Stevenson, in crying down F. A. Michaux, because of the time which has elapsed since he wrote, is not consistent when he himself is actually following an older authority in W. Aiton, who was head gardener at Kew in 1759, and died in 1793, and from whom J. C. Loudon obtained his information as to red pine. The originator of the epithet Pinus resinosa was probably D. C. Solander, a Swedish botanist born in 1736, but domiciled in England. He accompanied Sir Joseph Banks and Capt. Cook in their voyage round the world. Solander could have had little or no practical acquaintance with American red pine, for in his later years he was assistant librarian at the British Museum, hence the blunder in calling it P. resinosa. Michaux was quite right in correcting it to P. rubra, which probably would now have been adopted by all botanists but for the other term having been previously adopted by Aiton, Lambert, and others in their works. P. resinosa is obviously a most misleading term to use for designating the red pine, which Mr. Stevenson calls "an undurable wood," and by no means the most resinous of the pines. It was so obviously a blunder, that Mr. Tredgold, in his "Carpentry," applied it to pitch-pine, in which he was followed by Gwilt in his "Encyclopædia of Architecture." In the preface to his little book on the "Timber Trees of Commerce," Mr. Stevenson states that "For the botanical portions of my book I have relied almost exclusively upon the great standard work upon the subject, J. C. Loudon's 'Arboretum et Fruticetum Britannicum, London, 1838.'" Now as regards American timber trees, I have no hesitation in preferring Michaux as an infinitely better authority than J. C. Loudon (born 1783). Both he and his father, André Michaux, spent many years travelling in America making drawings, and describing on the site every tree he included in his great work, the "North American Sylva."—drawings accurately executed and beautifully coloured that won the admiration of everyone: his descriptions are most clear and systematic, and if this does not constitute an authority to be preferred to a botanist like J. C. Loudon, I do not know what does. Loudon could only have obtained his information second-hand. He was a most voluminous writer on several subjects, and was an invalid for the greater portion of his life. In much of his work he was assisted by his wife. After Michaux's death the subject was continued by Nuttall, an American botanist, and the edition of the "N.A. Sylva" quoted by me, and published in 1851, was edited by J. Jay Smith, another American botanist. As to the quality of red pine, which is much better known on the west coast of England and Ireland than at Hull, which imports its timber from the Baltic, my own experience, which extends back many years, is in accord with Laslett, who has not been correctly quoted by Mr. Stevenson, for in his book on "Timber," pp. 237 and 329, Laslett gives the average transverse strength and vertical or crushing strength of Riga fir as inferior to red pine, although his experiments show Dantzic fir to be superior. I may also mention that Mr. Stevenson has omitted to state that Laslett describes pitch-pine as Pinus rigida. To conclude, I would suggest to "Woodenhead" and "Sappy," if they reside in or near London, to consult the original authorities, and not be misled by Mr. Stevenson, Mr. Hurst, or anyone else who are of no authority as botanists.—J. S.

[10678.]—**Surveying.**—I think your correspondent "C. C. S." is rather severe on "A. W." for his harmless and innocent question. Though not a surveyor myself, it is a question that has often occurred to me, and I think there is some point in it. It seems to me to depend on whether the ground in question is to be surveyed for building or for agricultural purposes, and I should like to know whether it is the custom of surveyors to make any difference between the two. Supposing Farmer A. has a large perfectly level field measuring exactly 100 acres on one side of the road, while on the other side Farmer B. has an exactly similar field measuring exactly the same horizontally; but in this case, though the boundaries are perfectly level all round, immediately within the boundaries the ground rises on all sides, forming an immense hill in the centre. I submit that in these cases, though the two fields will show exactly the same size on plan, yet that of Farmer B. contains a vastly larger acreage either for pasturage or for the growth of cereals or root crops than that of Farmer A., and Farmer B.'s field will keep so many head of cattle in pasturage a much longer time than that of Farmer A. In other words, the superficial area of Farmer B.'s field is in reality much more than that of Farmer A. This question reminds me very much of a dispute between two Americans as to which of their respective States was the largest. I believe Georgia and Pennsylvania were in question. Yankee No. 1 boasted of Georgia extending over so many hundred square miles of territory, whereupon Yankee No. 2 retorted, with a remark which I think was very much to the point, that if all the hills in Pennsylvania were rolled out flat, it would lick Georgia into fits.—Vedra.

[10681.]—**Qualities of Timber.**—In reply to "J. H. S." I beg to offer the following remarks on "the best ports and brands of fir for building purposes at the present time." Riga affords very little hewn fir timber, which is matter of regret, for it is invariably good in quality, but hewn somewhat round on the face, "barrel sided." The sawn goods, "deals and battens," are very poor in quality and low in price, consequent upon their being so sappy. Dantzic and Memel, as of old, furnish the best hewn timber in Europe. It is quite a mistake to think these ports are used up: the reason why it is not so common in this country as formerly is that it is pressed out of the market by the American pitch-pine. The sawn goods from Memel are not generally in favour, and are now seldom seen they are good, hard, sound planks, but very sappy, and although invariably 4in. in thickness, they have been pressed out of the trade by similar sized Swedish goods. Fir timber for building purposes can be obtained from Baltic sawn goods which are shipped from 4in. by 14in. down to 1in. by 4in. Timbering above 4in. in thickness must be obtained from hewn timber, and here Dantzic and Memel timber is the best; but Swedish hewn timber, a soft, tender, class of wood, is often used. There are three qualities of Dantzic, and two of Memel and Swedish, the sorting being conducted in regard to the size and number of the knots, little regard being paid to the presence or absence of sap. The above notes dispose of timber over 4in. in thickness. With regard to those of 4in. and under, a deal may be said. The system of cutting these from Dantzic or Memel fir is practically a thing of the past, as it involves nearly double the cost of obtaining them from other shipments of converted goods. Setting this aside, we have a wide and a debatable field in Swedish, Finnish, and Russian goods, the latter only carrying the work so far as 3in. requirements are concerned. The merits of Russian goods is their softness and mildness. Hence they are valued for wrought or joinery work; but the common qualities shipped for timbering purposes have little to recommend them. They cannot, from their softness, be accounted durable, and they are shaken and coarse, the knots being invariably dead or faulty. I am of opinion that the medium qualities of the best shipments of Swedish goods are the most suitable goods in the trade. They are harder and more resinous, and hence more durable than Russian goods; but they are not so suitable for joinery, as the wood is liable to twist and warp in work. The best shipments of Swedish sawn goods are those of Gefle, Soderhamn, and Sundswall. These have red quality marks painted on the ends, and are shipped in four grades: mixed, thirds, fourths, and fifths. The furnishing of the marks is too great a subject here; but I may inform "J. H. S." that a book is published hereon by W. Rider and Son, London. A favourite London stock, and one often specified by architects, is Dixon Bros. and Co., of Swartvik, branded D. B. and Co. = B. D. = D. = M. F. D. for the respective grades. The qualities are regulated by the number and size of the knots, the best being not entirely free or clean; sap is not a matter of much consideration, and the lower qualities in Swedish stock may not be altogether die-square on the edges, in which latter respect they differ from Finnish and Russian goods. Finnish shipments are uniformly good for timbering; but they are too hard for joinery work. The best shipments are those of Bjorneborg, Kotka, and Wyborg; but they vary, especially at the latter port, with different shippers. These goods, along with those of Russia proper, are distinguished by the marks being impressed or stamped with the hammer, whereas the Swedish goods have the marks stencilled on in red paint. In some of the White Sea goods the qualities are marked with red chalk on the sides, a custom very common in American goods. No goods are shipped seasoned, in the full sense of the term: they are sufficiently dried to admit of shipment, and being placed in work as timbers; for bench work they require further seasoning. New Zealand woods, other than Kauri pine, are not readily obtainable in this country, and cannot be procured away from London. The shipments of Kauri pine, this and last year, were on a large scale to London, Hull, Newcastle, Glasgow, Liverpool, &c.; but the slow manner in which it has passed into consumption will not, I am afraid, induce other shipments to come forward. Most woods will shrink whenever a plane is put on them—i.e., when the dry face is removed; but Kauri pine is alone credited, in addition, with shrinking longitudinally. Australian woods must have some special qualities to warrant the high cost of their shipment to this country. The most likely, in my opinion, to permanently win a place is the Jarrah, or Australian mahogany (Eucalyptus marginata), of which Messrs. J. Walsh and Co., 81, Gracechurch-street, London, E.C. (who have published a pamphlet hereon), are the sole agents.—Wm. Stevenson, Queen's Dock, Hull.

CHIPS.

Mrs. Nicholls, the wife of Mr. D. Cubitt Nicholls, M.S.A., died on Sunday at their residence, 34, Brunswick-square, W.C., aged 50 years.

Under the auspices of the Glasgow Galleries Trust, an illustrated lecture on the subject of "The Sculptures of the Parthenon" was given on Saturday night by Mr. Pittendrigh Macgillivray, sculptor, in the Glasgow Corporation Galleries, Sauchiehall-street, in presence of a large audience.

The important post of Assistant-Director of the South Kensington Museum has been conferred by Viscount Cranbrook on Mr. C. Purdon Clarke, C.I.E., F.R.I.B.A., who was only recently promoted from the curatorship of the India Museum to the keepership of the art collections at South Kensington. Mr. Clarke will enter upon his new duties on the 1st proximo.

Mr. Lacey W. Ridge, F.R.I.B.A., writes that a grille which has been missing from Chichester Cathedral for some time has been found in a very dilapidated condition, and has been replaced in the building. The grille has been used as a model by Messrs. Halstead in making the screens by which the sides of the choir have recently been inclosed.

M. Vaussenat, a civil engineer of great eminence, and constructor of the famous observatory on the summit of the Pic du Midi, which was built about 15 years ago, has just died at Bagnères de Bigorre. He was a geologist of high repute, many of the discoveries in the Dauphiny and Savoy Alps being due to his researches.

Legal.

THE RIGHT OF PROSPECT.

NOT unnaturally, many people have an idea that a right to a prospect or view, or a "right of sight" as it is sometimes termed, can be acquired by prescription, as in easements, in the same way as can rights to light and air. But though this looks reasonable enough, it has never been recognised by English law. The idea of an old lawyer's was that in matters of necessity, such as light and air, these rights could properly be allowed; but a view or prospect from a house or building being merely matter of delight, could not be thus adopted. In one of the old cases, the authorities of Gray's Inn attempted to stop the erection of buildings which blocked the view from their gardens, and they failed on the ground that there was no rule of law by which building to stop another's prospect became a nuisance. And it was further pointed out that if such a right to view existed, it would prevent all new buildings, and towns would cease to grow. But there may, of course, be an agreement binding upon the parties to it, by which a certain prospect can be procured over specified land. These covenants may run with the land, and so maintain an open view from the property affected; but a right thus given by agreement is entirely different from an easement, as it cannot arise from mere prescription.

Nor can there be any right of this kind to an uninterrupted view of a shop window, for instance, or a shop sign. The Courts have always refused to recognise any prescriptive right to such a free line of view. In one case of a shop in Bond-street, the plaintiff sought to prevent his neighbour from making such alterations in his own premises as would prevent the plaintiff's shop from being seen so far down the street as it had been before. But the Court refused to interfere, and declined to recognise the acquisition of any right to an uninterrupted view by people coming up the street, as claimed by the plaintiff. So with a shop sign, such as a pawnbroker's three balls; there was nothing to prevent an adjoining neighbour building on his own ground so as to obstruct the distant view of such a sign, however long it may have been enjoyed before. But although there is no such easement as a right of prospect or view, yet it sometimes happens that a covenant not to obstruct a view—as, for instance, of a shop window—will be implied where a tenant takes premises upon which such a view obviously exists. This, however, would entirely depend on the facts of the case in question. Neither is there, in law, any right to an undisturbed privacy; and in the absence of covenant a man can always open windows overlooking his neighbour's land and house—although to his discomfort, and even damage—leaving that neighbour to put up a hoarding if he likes to block those windows.

Fred Weatherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Leith.—Contract.—Signature.—The builder who has signed is undoubtedly bound by the terms of the contract, except in so far as he has waived them, and supposing that the architect acted as agent of the employer in drawing up the contract, he may have been authorised to sign it also on his behalf. But, even without his signature, the owner would be bound by a contract to which he had otherwise assented and upon which he had acted, and because it has already been partly performed.

P. C.—Party-Wall.—Base.—The "base" of the party-wall can only be the part resting on foundations in the ground. Your argument is ingenious, but the effect of adopting your plan would be to have the wall crack just where the Act says it should be strong. I therefore consider that you must thicken the wall down to the base upon the ground.

A. D.—Shop.—Fixtures.—You must replace the things as they were when you took the place, and as you agreed to do. He cannot charge you rent for not doing so, as your tenancy is ended, but he can sue you for damages.

A. D. T.—Wall.—Overhanging Eaves.—Your neighbour has, strictly speaking, no right to drain from his roof into your garden, and you could remove what overhangs; but probably the best plan would be to summon him in County Court for damages, and so settle the question.

Jack Plane.—Employers' Liability—Owner.—The building owner does not in any sense employ the workmen, and so cannot be liable in damages for accidents. The contractor is their only employer, and he would be responsible within the Act.

LEGAL INTELLIGENCE.

Contracting Cabinetmakers' Custom.—David Sandground, master cabinet-maker, of Philip-street, Shoreditch, was summoned to Worship-street on Saturday by two journeymen cabinet-makers named John William Gill and William Williams, for £4 3s., money due on a contract which they complained they were not allowed to finish. A counter claim was made by Mr. Sandground against the men for unfinished work and damage to material to the amount of £5. The two complainants stated that they, working in partnership, and in defendant's shop, engaged to make three sideboards for a contract price of £8 5s. The work was commenced on 18th November, the contract being in writing. According to Gill, the whole of the work could have been done in six days. Having worked five days, the men on Saturday received half the contract price as a payment on account. On the Monday Gill said they did not touch the work, feeling "lazy." They worked four and a-half hours on Tuesday, and then went to a meeting of the trade, held at a public-house, and remained away the rest of the day. It was admitted that the meeting was a strike meeting, and on Wednesday a deputation of men waited on Sandground to discuss their grievances. Gill was one of the deputation, and said that defendant refused to listen to anything until those who had contracts in his shop returned to work, and further warned them that if they did not return by two o'clock that day they would be locked out. They did not return, but Gill and others with contracts went at half-past eight on Thursday morning and were refused admission. This was a test case, as some 17 or 18 men had left the shop under the same circumstances.—Mr. Bushby asked if it was claimed as a right by the workmen that they might leave a contract job before it was finished, instead of doing the work day by day. The complainants, it was said in reply, contended that the custom of the trade sanctioned their leaving when they wanted a day off, and Williams, in his examination, said that if the workman wanted time off he took it, and neither asked leave nor gave any explanation. He said he had known a man stop away three days; but it was admitted that the practice did not relate to contracts to be completed within a given time. Mr. Bushby said it was a serious contention, because it meant that the work stood still at the pleasure of the workman, though, of course, the law would hold that a contract without a stipulated time meant a reasonable time. He was not prepared to admit the contention of the workmen. Mr. Moore, for complainants, said he had ample evidence to prove the custom of the trade. Mr. Benjamin, for defendant, replied that nearly every master would prove that there was no such custom. Mr. Bushby said this question would be settled by the custom, and the question of a strike would not enter into the judgment. The case was adjourned for a fortnight for evidence as to custom.

An Architect's Fees.—Arrangements have, the *Scotsman* states, been made under which a settlement has been arrived at in the action by the late Mr. John Rhind, architect, Inverness, against Sir John Ramsden for £2,034 odd as balance of fees in connection with the designing and building of the mansion-house of Ardverikie and other works on Sir John's estate. The chief contention of the defender was that the pursuer had originally estimated the cost of the mansion of Ardverikie at £12,758, whereas it had cost upwards of £32,000. Sheriff Blair found that no agreement was made between the parties as to remuneration, that there was no warranty by the pursuer that the works should not exceed the estimates, and found that £2,300 was a fair value for the work done, and after deducting a sum of £1,600 paid to account, gave judgment for the balance of £700, with expenses. The decision was appealed to the Court of Session, but under the minute which has been boxed, the appeal, it is understood, will be withdrawn, and Sheriff Blair's judgment approved of.

Building without Capital.—Re Francis Benedict Madden.—At the Liverpool Bankruptcy Court on Friday, Mr. F. B. Madden, a builder at Southport, came up for public examination with a statement of affairs showing liabilities £3,671, expected to rank £345, and assets £462, consisting mainly of equities. The debtor said he was a plumber by trade, and filled in his spare time by working on buildings he was erecting. In 1887 he built houses on leasehold land at Birkdale. He had no money at the time, but received advances as he went on. He thought it was possible to carry on the building trade without any capital, but the success of the business depended upon the mortgagees and the amount of advance to start. He had a very good mortgagee, but he had lost on his building speculations. The examination was adjourned to January 7th.

An Aberdeen Building Dispute.—In the Edinburgh Outer House on the 16th inst., Lord Kyllachy closed the record and sent the case to the procedure roll for discussion in an action at the instance of Alexander Middleton, a cattle salesman in Aberdeen, against three Misses Leslie, all of Powis, near Aberdeen. The pursuer sues for decree that the defenders are bound to erect on all and whole a piece of ground on the south side of Belmont-road, Aberdeen, one or more dwelling houses, or shops and dwelling houses, similar to the houses already erected by the pursuer on the south side of Belmont-road, Aberdeen, or cottages or two-story houses not inferior to those on the north side of the said road. The summons concludes alternatively for £800 damages failing the defenders to erect said buildings. The pursuer says that in 1889 he disposed by feu disposition to Roderick M'Kay, contractor, Aberdeen, the piece of ground above referred to on the south side of Belmont-road, Aberdeen, for payment of £25 yearly as feu-duty. By the said feu disposition it was provided that the said Roderick M'Kay should be bound within two years from his entry to erect on the ground disponed houses of the description above mentioned. The pursuer further says that M'Kay entered into possession, but failed to erect any buildings, and by disposition dated and recorded in May, 1889, he conveyed the subjects to, and in favour of, the defenders, subject to the provisions of the said feu-disposition. The defenders state that they acquired the ground in question for the purpose of obtaining an additional access to their feuing ground on that side, and regulating the nature of the new houses to be erected near Berrybank House. It is their intention, whenever possible, to erect buildings sufficient to secure the rights of the pursuers. The defenders further say negotiations had been going on for the widening of Berryden-road in the district. The scheme was, however, found impracticable. Afterwards plans were submitted to the town council for an alternative scheme, which contemplated a new street with a spur, giving access to the pursuer's feuing ground. They say that the direction which this new street may take must affect the subject of the action, and that it would be against the public interest to proceed to build in the mean time.

Dispute as to Rating Jurisdiction.—The dispute as to jurisdiction which has long existed between the Corporation of New Romney and the New Romney Commissioners of Sewers was decided on Thursday in the Queen's Bench Division. The Lord Chief Justice, who tried the action in July and November last, now delivered judgment. He said he had paid a visit to the place, and found that the face of the country had altogether changed since the time when New Romney became one of the Cinque Ports, and when ships came up to the walls of the town, which were now two miles from the sea. The corporation had in past times spent large sums upon sea defence, and he held that its property was exempt from rates levied by the commissioners, though he believed that the latter body had, in the course they had taken, acted from a sense of public duty. Judgment was, therefore, entered for the New Romney Corporation, with costs on the higher scale.

CHIPS.

A movement has been started to raise £2,500 to rebuild the tower of Great Chesterfield Church upon the site of a tower which existed some centuries ago, the foundations of which have been recently discovered.

On Saturday afternoon, in the Old Aisle Cemetery, Kirkintilloch, there was unveiled a memorial, erected by public subscription, to commemorate the philanthropic labours of the late Miss Beatrice Clugston, the founder of the Broomhill Home for Incurables and Convalescent Homes at Dunoon and Lenzie. The memorial took the form of a monument in Dumfries red stone, after a design by Mr. W. F. Salmon, architect, Glasgow, and with a cast bronze panel inserted in the front of the monument.

The parish church of Ashstead, near Leatherhead, is undergoing restoration at a cost of £1,600. The building will be reseated throughout, and the work also include the provision of new roof, chamber, and vestry.

A movement for the erection of a memorial of Edward Irving in his native town of Annan has lately assumed a definite shape. A statue of the great preacher has been modelled by Mr. Dods, sculptor, Dumfries, and the committee propose to unveil the memorial on the 4th August, 1892, the centenary of Irving's birth.

The Watch Committee of the Liverpool City Council have approved of a report of Mr. Percy Boulnois, the city engineer, recommending that his department should obtain information from and visit such towns or localities as may be deemed desirable for the purpose of making investigation into the question of public street lighting.

At the Barnstaple County Court on Friday, his Honour Judge Paterson granted a discharge to Francis William Abbott, builder, of Barnstaple, the order to be suspended for nine months. The liabilities amounted to £283, and the assets to £4.

WATER SUPPLY AND SANITARY MATTERS.

Birkdale Drainage Scheme.—Major-General C. Phipps-Carey, R.E., inspector to the Local Government Board, held last week a four days' inquiry, at Birkdale Town Hall, into the local board's application to borrow £19,600 for works of surface drainage, sewage effluent outlet, and street improvements. No objection was raised to any part of the application save that section which proposed to discharge the effluent from the sewage works into the tide. This the Southport Corporation, the principal public companies of Southport, the chief Birkdale boarding schools, and many Birkdale ratepayers and property owners sent legal representatives to oppose; and most of the opponents were prepared with the evidence of experts to support the opposition, based partly on sanitary grounds and partly on what was termed sentiment, but which, in a health resort, as one witness stated, was easily translatable in pounds, shillings, and pence. On Friday, the fourth day, the inquiry came to an unexpected and amicable conclusion. The Birkdale Local Board agreed to adopt the international system of treating their sewage, as recommended by the expert witnesses of the Southport Corporation, Dr. Franklin and Mr. James Mansergh. The town clerk of Southport intimated that a further suspension of the injunction against the Board would be granted until the scheme was completed. By this decision the effluent water will continue to be discharged into Fine Janes Brook as at present, and the Corporation maintain it will not pollute the brook.

East Brook and Dynas Powis Water Supply.—After a considerable amount of trouble, the Cardiff Rural Sanitary Authority have now supplied the above places with a good supply of wholesome water. East Brook, a village half-way between Cardiff and Barry, was formerly supplied with water from about one hundred wells sunk some 20ft. or 30ft. in the neighbourhood of cesspools, and surrounded with land highly manured, from which the rain water carried liquid manure into the water. The village of Dynas Powis was supplied from a reservoir and a system of pipes, ranging from 3in. to ½in. in diameter; but the supply in the summer-time was always short, and had to be distributed on the intermittent system, which was found to be both wasteful and exceedingly unsatisfactory. After various suggestions as to the best means of augmenting the supply, the Rural Sanitary Authority applied to the Cardiff Corporation for a supply of water for both East Brook and Dynas Powis, the Corporation to lay the pipes and collect their own water rates at East Brook, being within their Parliamentary district, and supply Dynas Powis in bulk. This request, after some preliminary arrangements, was granted in an amicable manner, and the work of laying the mains and fittings through East Brook was admirably carried out by Mr. Priestly, A.M.Inst.C.E., deputy water engineer to the Cardiff Corporation. The extension and distribution of the Dynas Powis water supply was carried out under a considerable difficulty, inasmuch as the excavation was entirely in rocks; but the work was carried out without a hitch by Mr. William Fraser, A.M.Inst.C.E., surveyor to the Authority. Mr. Edmund Lewis, of Dynas Powis, was the contractor for the excavation, and Messrs. Cross Bros., Cardiff, for the supply and fixing of mains and fittings. The cost of the whole of the works was about £2,000.

The partnership heretofore subsisting between Hughes and Pugh, of Newport, Mon., builders and contractors, has been dissolved.

In an appeal by the Metropolitan Railway Company against an assessment of their tunnels to the land tax, the Master of the Rolls and Lord Justice Kay decided on Friday that the company were liable to pay that duty; but Lord Justice Lopes was of a contrary opinion.

A memorial brass, designed to suit the architectural features of the justly celebrated Norman church at Melbourne, near Derby, has just been erected in the Cantrell chapel to the memory of the last bearer of that name, who was buried in the cemetery at Melbourne. The distinctive feature of the design is a large copper cross embellished with agates. The inscription is written in Mediæval Latin, and is inclosed in an incised border of a Celtic character. The work was intrusted to Messrs. Jones and Willis, of Birmingham and London.

A memorial lectern has been given by Mrs. Firth to St. John's Church, Ranmoor, Sheffield. The structure is of brass, stands about 6ft. high to the centre of the reading slope, and weighs about 4cwt. It has been designed by Mr. Pippett, and executed by Messrs. Hardman and Powell, of Birmingham, and is in Late Decorated Gothic style. There is a massive central pillar, with four other pillars and tracery forming buttresses. At the top of each of these are four archangels with outspread wings, while two cherubim, each about 18in. high, support the open-work reading desk.

STATUES, MEMORIALS, &c.

Edinburgh.—The statue of Queen Margaret has now been erected in front of the National Picture Gallery, Edinburgh, and the corresponding statue of King Malcolm Canmore is in process of erection in the corresponding niche on the other side of the doorway. This is the first practical step towards the carrying out of the scheme of decoration of the building with statues adverted to by the late Lord President Inglis at the opening ceremony of 15th July 1889. The figure of Queen Margaret, the work of Mr. Birnie Rhind, is 6ft. 6in. in height, exclusive of the plinth. It represents the queen, supporting in her left hand, and pointing to it with her right, a small model of a church. The statue of the king, Malcolm Canmore, which is to occupy the corresponding niche at the east side of the doorway, has been executed by Mr. John Rhind. The king is attired in a hauberk of mail with a short sleeve and conical-shaped helmet with nasal, while from his shoulders hangs a cloak. The cost of these figures, executed in the stone and colour of the main building, has been about £200 each. The Board of Trustees for manufactures have just received and accepted an offer of another statue, that of Mary Queen of Scots, which is to be presented by a body of Edinburgh ladies.

CHIPS.

St. John's Church, Longsight, Manchester, which has been closed for repairs and additions since July last, will be reopened for service to-day (Christmas-day).

Probate duty has been paid on £243,546 as the value of the personal estate of Mr. George Meakin, late of Creswell Hall, Staffordshire, earthenware manufacturer, who died on the 15th September last, aged sixty years.

At the Franciscan Church, Limerick, on Sunday, a new organ was solemnly opened. It has been built by Mr. John White, of Dublin.

The premises of Messrs. Willing and Co., Limited, enamellers in iron, in Clerkenwell-green, were destroyed by fire on Friday. The buildings measured 60ft. by 25ft., and were five stories in height.

In the case of Robert Evans, of Southdown-road, Wimbledon, architect and surveyor, the Registrar of the Bankruptcy Court has granted a discharge, subject to certain conditions.

At the last meeting of the committees having charge of the erection of the statues to the memories of the late Thomas and Sir Peter Coats, of Paisley, for which over £4,000 have been collected, a letter was read from Mr. Dunn, M.P., offering two sites on the vacant space at Paisley Cross. The offer was accepted, and a committee was appointed to obtain competitive designs.

The Gilesgate Infant Board School, Durham, is about to be enlarged for the Durham School Board, from designs by Mr. H. T. Gradon, architect, Durham.

Mr. John Dugdale, who for the last 25 years had been engineer to the Chester Waterworks Company, died at his residence, Boughton, Chester, on Thursday, the 17th inst., from heart-disease and peritonitis, at the age of 65.

The King and Queen of Italy opened on Friday a new bridge across the Tiber, a work begun in 1889. It is reached from the Porta del Popolo by two converging roads immediately opposite the entrances to the Pincian. The bridge, with the foundations, has cost £310,000 sterling, and is named Ponte Margherita, after the Queen.

Mr. H. Soper, builder, of Brent, left home the other morning for Great Aish, where he was erecting a building, and near the village he was found lying in the road dead, his pony standing not far off. It is supposed that the pony stumbled, and that Mr. Soper in falling off pitched on his head, breaking his neck.

At the Staffordshire Assizes, held at Hanley on Wednesday week, Howard Robert Ram, aged 52, an estate agent, of Newcastle-under-Lyme, was sentenced by Mr. Justice Day to seven years' penal servitude, for forging transfers of shares in a Starr Bowkett Building Society.

Wolston Baptist chapel, Coventry, was reopened on Friday after renovation and improvement. The work was carried out by Mr. J. Worwood, of Coventry.

To improve the drainage of a large tract of low-lying land on the shores of Morecambe Bay, and to overcome the silting process which is going on at a considerable rate in consequence of reclamation operations, powerful pumping plant has just been put down by Messrs. Tangyes, of Birmingham. Messrs. John Hopkinson and Son, of Princess-street, Manchester, with whom has been associated Mr. E. Howard Dawson, F.S.I., of Lancaster, were the engineers, the whole cost of station being about £2,000.

Our Office Table.

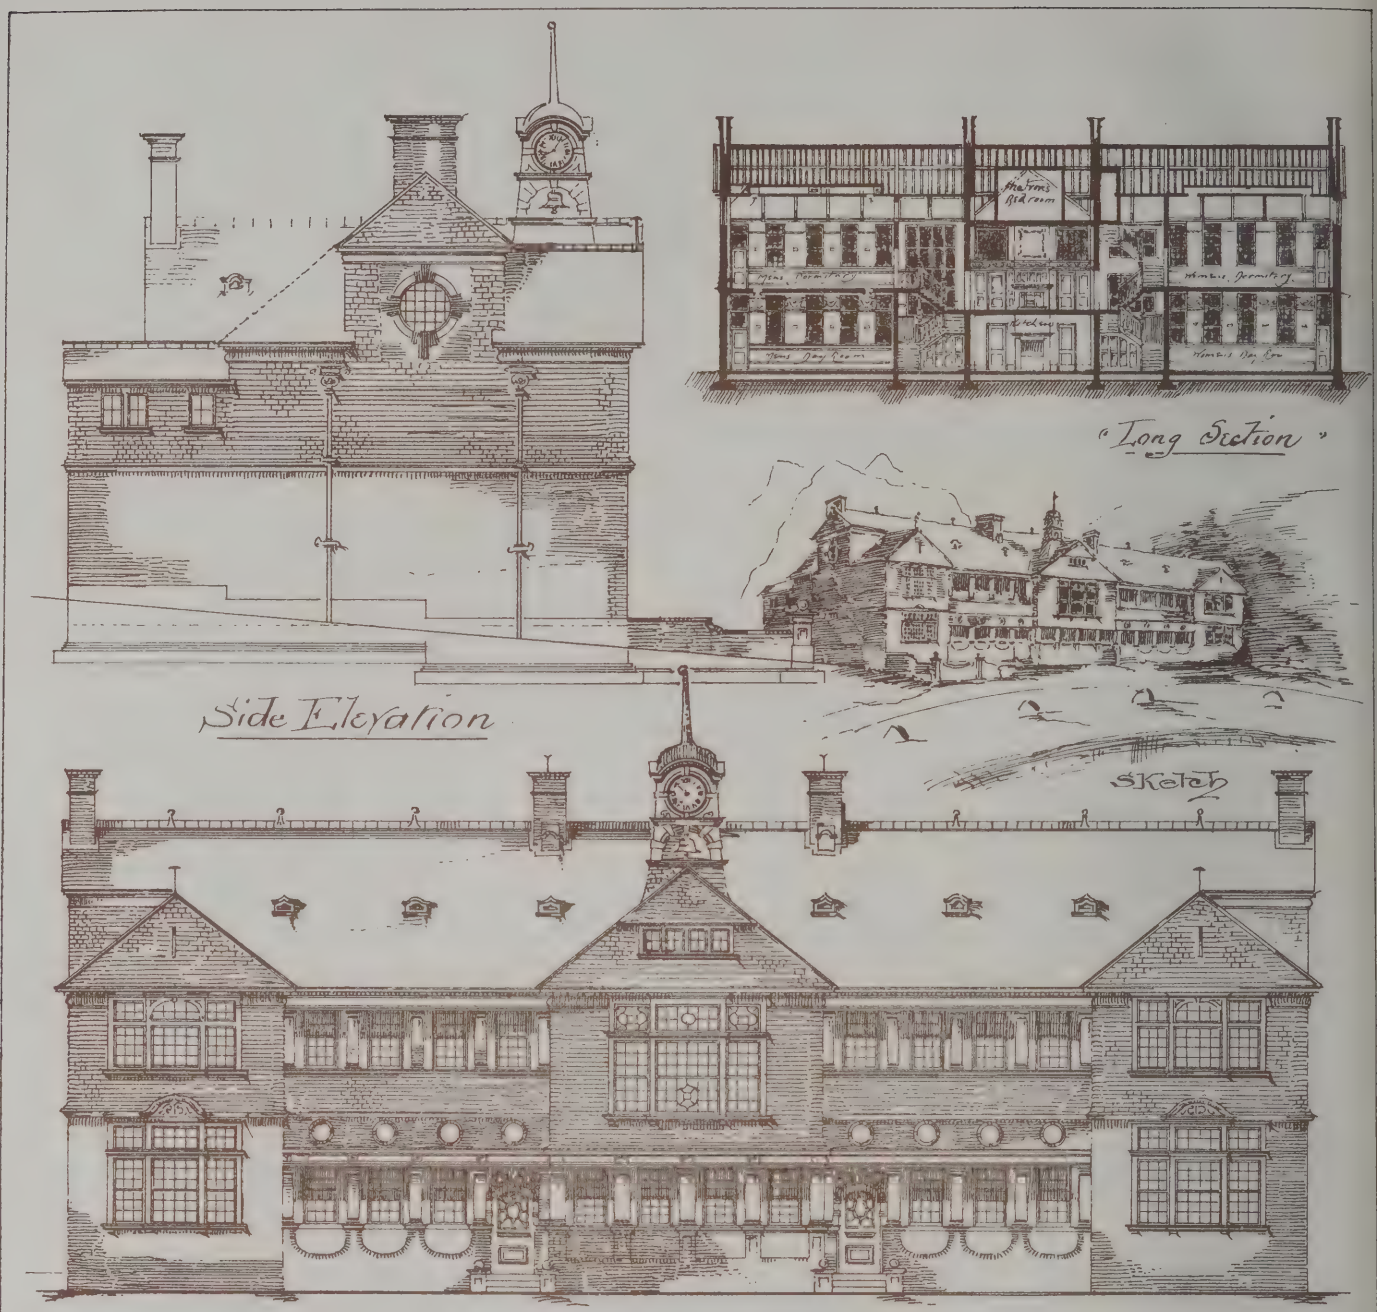
The death is announced of Mr. Edwin Thomas Howell, architect and surveyor, of Southampton, which occurred at his residence, Laura-place, in that town, last week, after an illness of six weeks, in his sixty-eighth year. Mr. Howell was a native of Southampton, and for a long period he was actively identified with the Polytechnic Institution, of which at the time of his death he was one of the vice-presidents. He was also a director of a local building society, and surveyor to the County of Hants Land and Building Society. He was more widely known as the architect and surveyor to the Southampton School Board. He was appointed to that position by the first Board, elected over twenty years ago, and has retained it ever since. The School Board offices, and all the school buildings and works connected with the School Board, have been erected under Mr. Howell's immediate supervision. During his illness his office has been temporarily filled by Mr. J. H. Blizard, of the firm of Lemon and Blizard. He was a prominent member of a local Freemasons' lodge, of which he was the senior past master.

The Middlesex County Council have referred to a committee for consideration and report a new scheme drawn up by the chairman, Mr. Littler, Q.C., C.B., for the acquisition in the public interests, of the Alexandra Palace and Park. It was explained that the Financial Association, who now own the Palace and grounds, will sell the whole of the 414 acres to the Middlesex Council for £275,000. There are 28 acres of leasehold, the purchase of which would cost about £16,800. Mr. Littler suggests that the partitions in the buildings should all be removed, and that the Palace should be thrown open from end to end, a number of semi-hardy trees being placed in the building, so as to form a public covered promenade. The amount required for the purpose of buying the buildings and grounds would be about £300,000. The London County Council might, the chairman is sanguine enough to think, give £100,000; the Corporation of London, £40,000; the Middlesex County Council a modest £15,000; and the remainder, £145,000, by the local authorities, possibly including the railway companies interested. Some small strips of land around the Palace and Park could be used for building purposes, and would bring in about £2,100 a year.

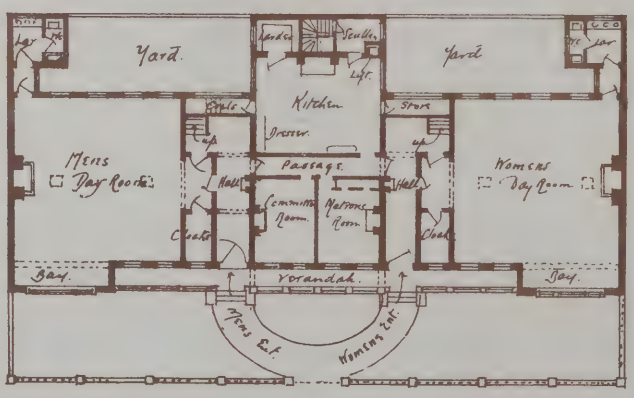
The recent disfigurement of the river façade of Somerset House by the hideous brickwork additions to King's College was brought before the London County Council by Mr. Arthur Arnold at their last meeting; but, as might have been expected, the chairman of the Building Act Committee, who replied to the interrogation, could only express regret that the County Council had no control over the matter.—Even Her Majesty's Commissioners of Works are equally powerless, for Mr. Plunket has written, in reply to a letter from Mr. Anderson, P.R.I.B.A., explaining that he had already communicated with the Council of King's College, claiming that the assent of the Crown was necessary before additions could be made to the College buildings. To this the council demurred, and Mr. Plunket now, to his great regret, finds their assertion of independence of all control supported by the law officers of the Crown.

At King's College, on Thursday night in last week, there was an exhibition of work with presentation of prizes gained by students in the wood-carving and architectural and building construction classes, which have the support of the Carpenters' Company, in connection with the council of King's College. The proceedings took the form of a conversazione, ladies joining in the initial reception by the Rev. Dr. Wace and members of the court of the Carpenters' Company. There was an exhibition of work on the walls of the corridors, and in the many classrooms, whilst entertainment was provided by Professor Banister and Mr. B. F. Fletcher in a magic-lantern display of views of some of the most celebrated buildings of the world. In the theatre of the institution Mr. Henry Harben, L.C.C., distributed the medals and prizes to the successful students. About £120 in money and a number of silver and bronze medals were distributed, and Professor Banister Fletcher told the company that there are at present 590 students in the evening classes and 215 in the day classes. This was a valuable course of education, which Mr. Harben had recognised by the gift of £100, to assist in carrying on. Mr. Henry Harben, L.C.C., after distributing the prizes, referred to the work to be seen on all hands that night as proof of the perfection to which architectural drawing and construction may be brought.

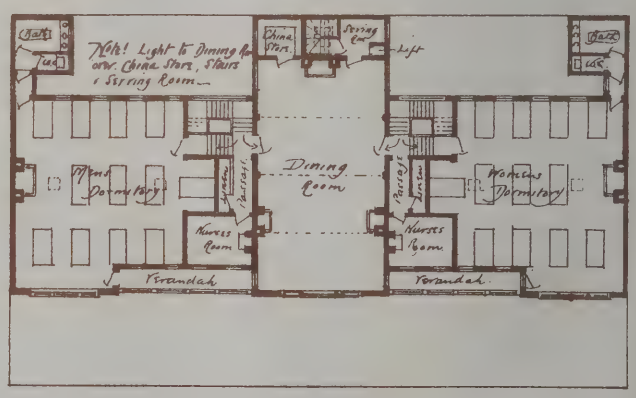
A valuable collection of original drawings and sketches by British artists has been presented to the Nottingham Castle Art Museum by Mr. Felix Joseph, who had previously been a munificent contributor to the Museum, and the gallery containing the collection was formally opened by the Duke of St. Alban's, Lord-Lieutenant of the county. There are 457 sketches by Thomas Stothard, R.A., and about 600 drawings by other artists, including Robert Smirke, E. M. Ward, Paul Sandby, John Flaxman, Richard Westall, George Cattermole, Henry Fuseli, J. T. Sargent, Thomas Uwins, C. R. Leslie, and sixty others, all of whom are more or less connected with the illustration of books in the early part of the century.



The old boundaries of the city of Vienna were abolished at midnight on Sunday, and Greater Vienna was formally inaugurated. By the breaking down of the old excise wall, and the removal of the toll houses, the area of the city is enlarged from 55 to 178 square kilomètres, making the capital half the size of London, more than twice as large as Paris, and nearly three times the size of Berlin. The population has, however, only increased from 900,000 to 1,300,000. The excise wall, which is about to be demolished in connection with the works for the proposed Metropolitan Railway, only dates from 1738, when it replaced in masonry an earthern rampart, constructed 34 years earlier as a protection against the invasion of the Hungarians. As fortifications, the Linien were insignificant, but they formed an outer girdle to the circle of battlements and bastions which covered the space over which the Ring, with its magnificent public buildings, now stands.



On Saturday last the annual dinner of the well-known firm of architectural and constructional ironfounders, Steven Bros. and Co., 4, Upper Thames-street, E.C., was held at the Freemasons' Tavern, Great Queen-street, the president being Mr. Alexander Ritchie, C.C. The customary loyal and other toasts were duly honoured, that of "The Visitors" being responded to by Mr. V. M. Navalkar, of the firm of Thomas Black and Co., plumbers and sanitary engineers, Bombay, who is on a business visit to the United Kingdom. Mr. Muir proposed the toast of the parent firm, "McDowall, Steven, and Co.," Glasgow, and was followed in response by Mr. Grimmond, a representative of the Glasgow house. One of the senior travellers of the firm, Mr. Lockwood, then proposed the toast of the evening, "The President," which was drunk with great enthusiasm, and called forth from Mr. Ritchie an appropriate speech, concluding with the hope that for many years to come he would have the pleasure of being present on the occasion of such reunions. A well-selected programme of vocal and instrumental music was carried out by a number of the employés, and altogether a very harmonious and pleasant evening was spent.



The Unity Building in Chicago, the loftiest in the world, is almost completed. Although it is sixteen stories high, the perpendicular is said to be only a little more than half an inch out of plumb; and one of the first civil engineers in the United States has recently reported that the foundations are thirty-three and one-third per cent. stronger than the average. The exterior of the building has often been described, but not the interior. The main entrance rises in a Roman arch to the second story. The grand hall or corridor is wainscoted in marble, and the gallery affording entrance to the offices on the second story is also of marble. Six elevators, having a front of silver-plated metal-work, run from the basement to the sixteenth story. The stairway is of steel, with marble steps, and everywhere throughout the building is seen the combination of silver plate and marble. The partitions between offices are of hollow tile and crystalline glass, the wainscoting and woodwork of oak, and the floors of white maple. The illumination is furnished by electricity. The light-shaft extends from corridor floor to roof, and is lined with white porcelain brick. In the Unity, the Auditorium, and the Rookery, Chicago now has three of the largest buildings of their kind in the world.
